  - What will happen when memory is not enough?
  - How to organize the memory?
- Memory management
  - Translation look-aside buffer
  - Page table
  - Multi-level page table

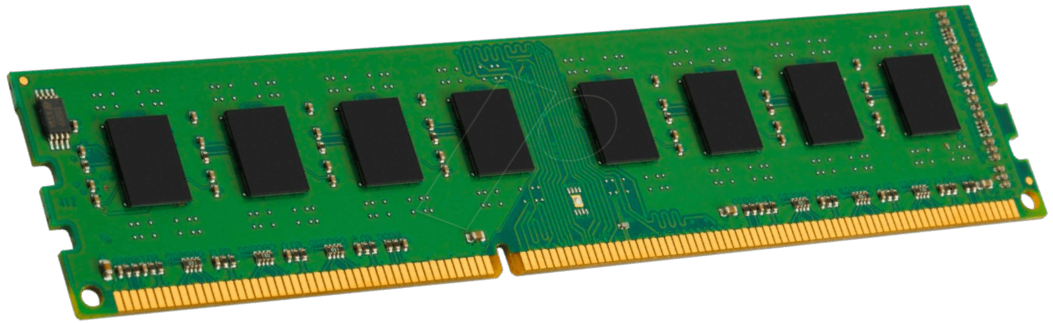
Why we need memory management

- Ideally user/programmers want memory that is
  - Size?
    - large --> 1GB, 2GB, 4GB, 16GB, …
  - Speed?
    - fast --> DDR 2, DDR 3, DDR 4, …
  - Durability?
    - non volatile --> not lose data when losing power



Why we need memory management

Ideal: programmers/users want memory that is	Reality: Memory hierarchy
large	
fast	
Non-volatile	

Memory management handles the sematic gap

Why we need memory management

Ideal: programmers/users want memory that is	Reality: Memory hierarchy
large	small amount of fast, expensive memory e.g., register, cache
fast	some medium-speed, medium price main memory, lots of slow, cheap disk storage
Non-volatile	Volatile (e.g., top hierarchy)

Memory management handles the sematic gap

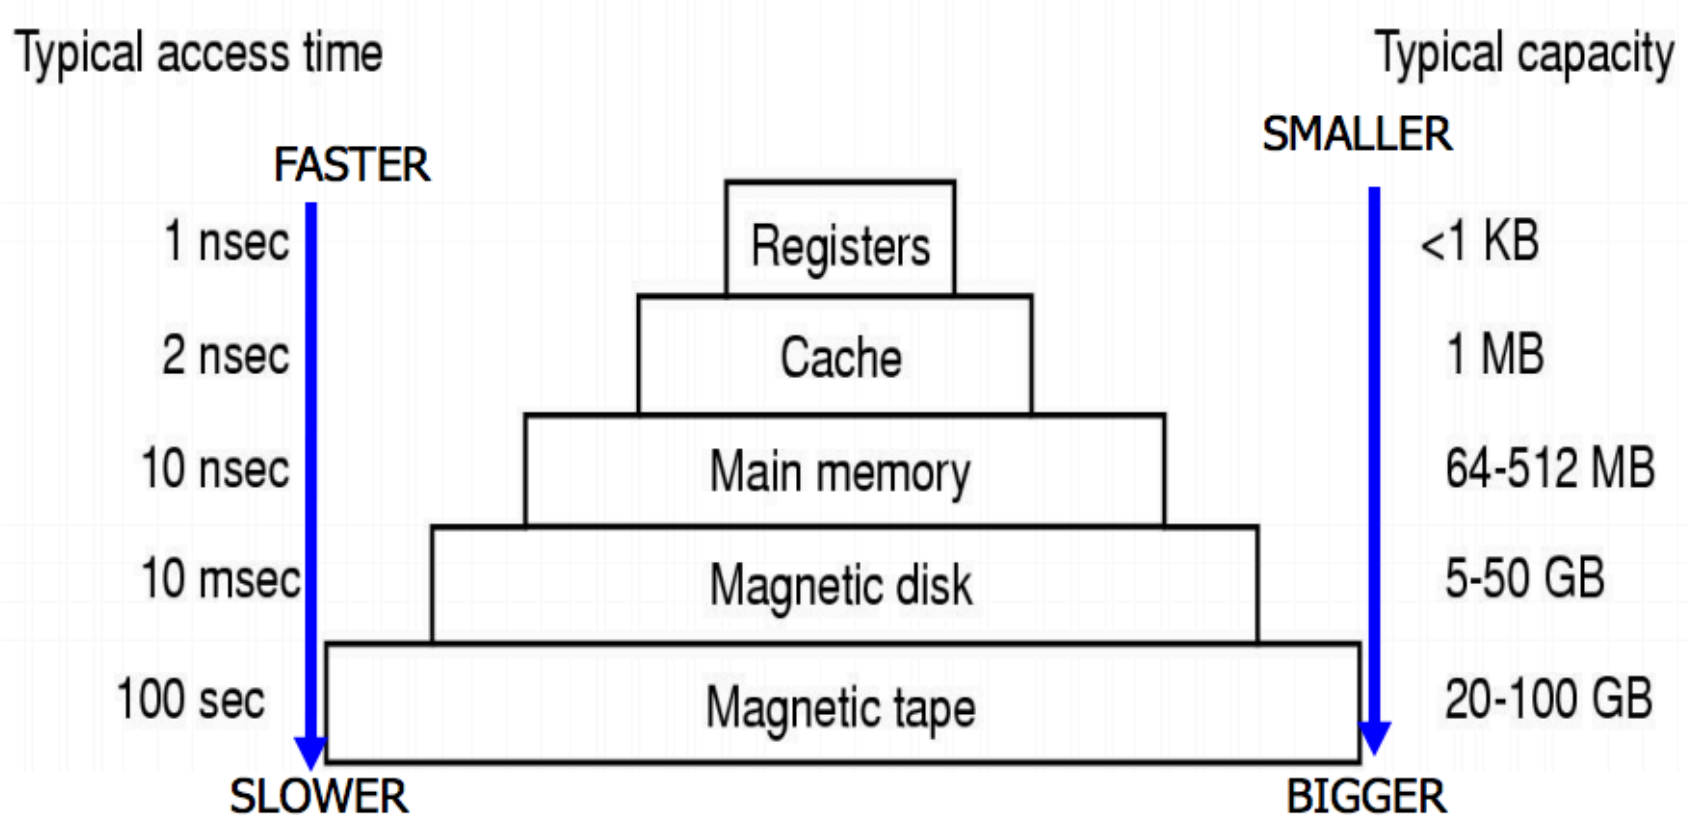
Typical Memory Hierarchy



Typical Memory Hierarchy

System Event	Actual Latency	Scaled Latency
One CPU cycle	0.4 ns	**1 s**
Level 1 cache access	0.9 ns	**2 s**
Level 2 cache access	2.8 ns	**7 s**
Level 3 cache access	28 ns	**1 min**
Main memory access (DDR DIMM)	~100 ns	**4 min**
Intel® Optane™ DC persistent memory access	~350 ns	**15 min**
Intel® Optane™ DC SSD I/O	<10 µs	**7 hrs**
NVMe SSD I/O	~25 µs	**17 hrs**
SSD I/O	50–150 µs	**1.5–4 days**
Rotational disk I/O	1–10 ms	**1–9 months**
Internet call: San Francisco to New York City	65 ms	**5 years**
Internet call: San Francisco to Hong Kong	141 ms	**11 years**

10x than cache

1000x than memory

20x than SSD

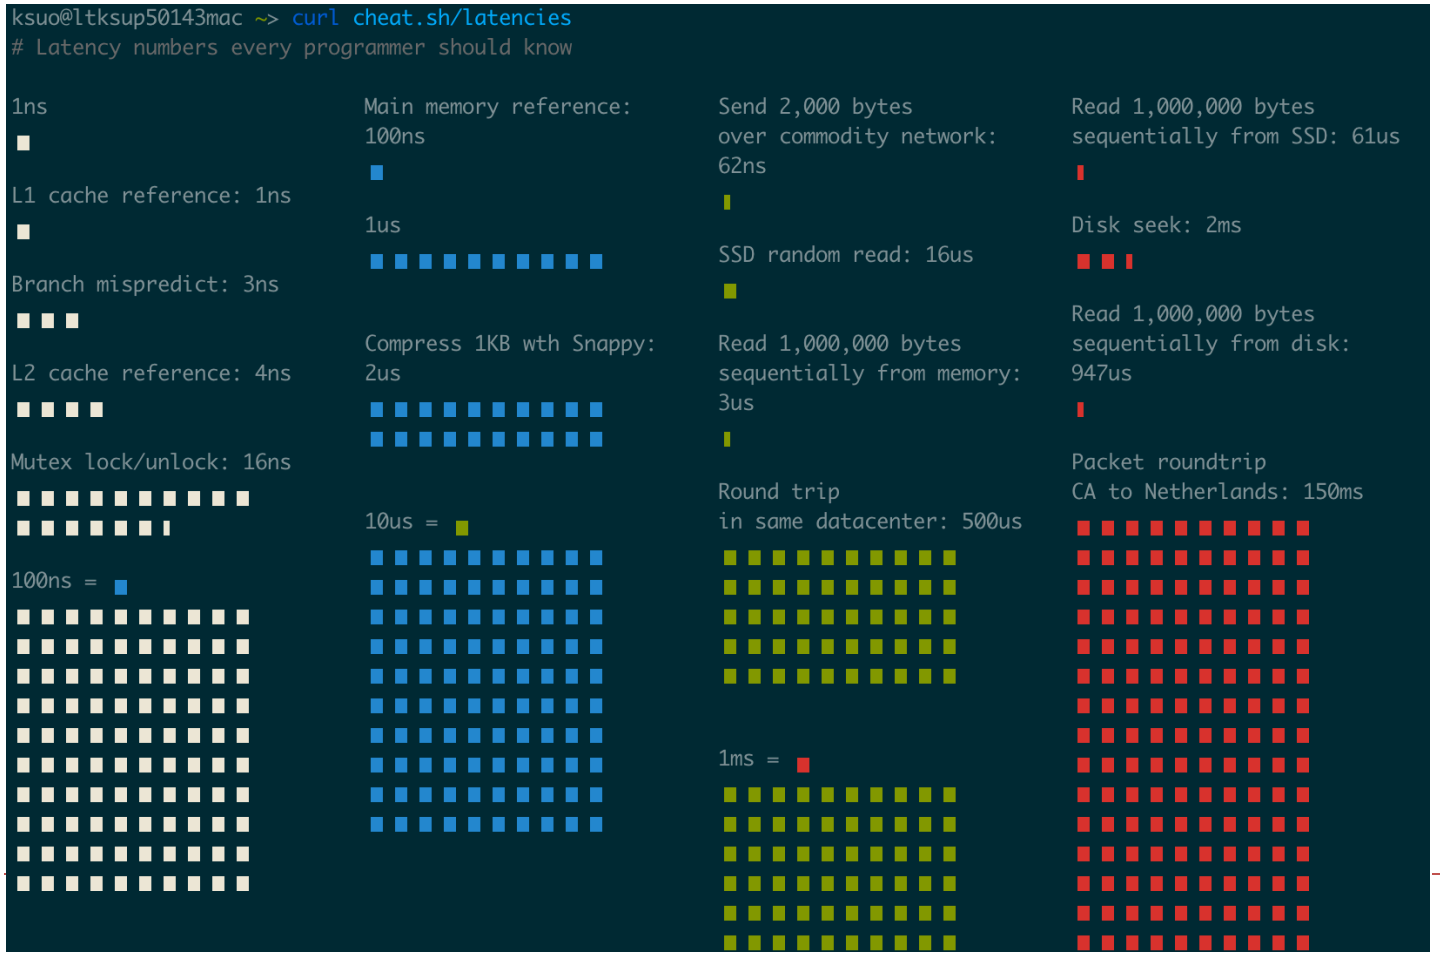
Latency numbers every programmer should know

- curl cheat.sh/latencies



Test: what is the speed of your memory?

- STREAM Benchmark:

  it can measure the performance of the memory system, including bandwidth and latency.

  https://www.cs.virginia.edu/stream/

```
-------------------------------------------------------------
Function      Rate (MB/s)   Avg time     Min time     Max time
Copy:       16302.4084       0.0026       0.0020       0.0031
Scale:      13411.0440       0.0029       0.0024       0.0040
Add:        15529.6662       0.0041       0.0031       0.0050
Triad:      12889.0264       0.0042       0.0037       0.0047
-------------------------------------------------------------
```

Test: what is the speed of your memory?

Copy

```
void tuned_STREAM_Copy()
{
    int j;
        for (j=0; j<N; j++)
            c[j] = a[j];
}
```

Read from one memory cell
Write to another memory cell

Test: what is the speed of your memory?

Scale

```
void tuned_STREAM_Scale(double scalar)
{
    int j;
    for (j=0; j<N; j++)
        b[j] = scalar*c[j];
}
```

Read from one memory cell
Make a multiply operation
Write to another memory cell

Test: what is the speed of your memory?

Sum

```
void tuned_STREAM_Add()
{
    int j;
    for (j=0; j<N; j++)
        c[j] = a[j]+b[j];
}
```

Read from two memory cell
Make an add operation
Write to another memory cell

Test: what is the speed of your memory?

Triad

```
void tuned_STREAM_Triad(double scalar)
{
    int j;
    for (j=0; j<N; j++)
        a[j] = b[j]+scalar*c[j];
}
```

Read from two memory cell
Make an add operation and a multiply operation
Write to another memory cell

Test: what is the speed of your memory?

- 1, Download STREAM Benchmark

  $ wget https://www.nersc.gov/assets/Trinity--NERSC-8-RFP/Benchmarks/Jan9/stream.tar

- 2, Compile & run

  $ tar xvf stream.tar

  $ gcc stream.c -o stream

  $ ./stream

Test: what is the speed of your memory?

- 1, install memory bandwidth app

  $ sudo apt-get install mbw

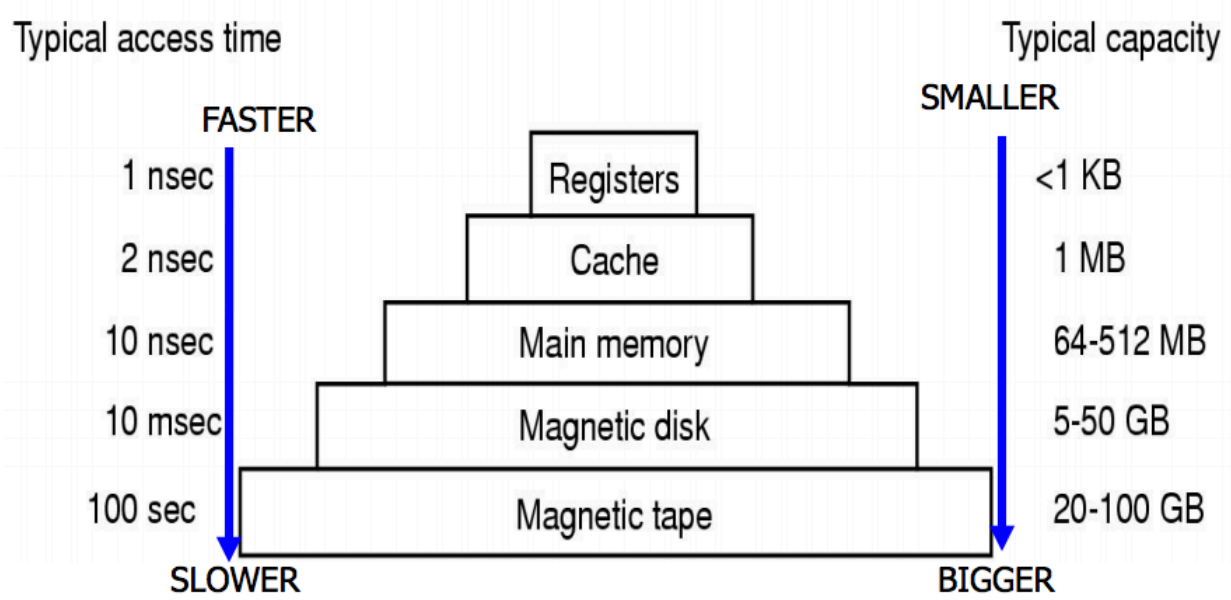
- 2, run

  $ mbw -q -n 100 256

n: run 100 times

256: means test 256MB in memory

Why we need memory hierarchy like this?

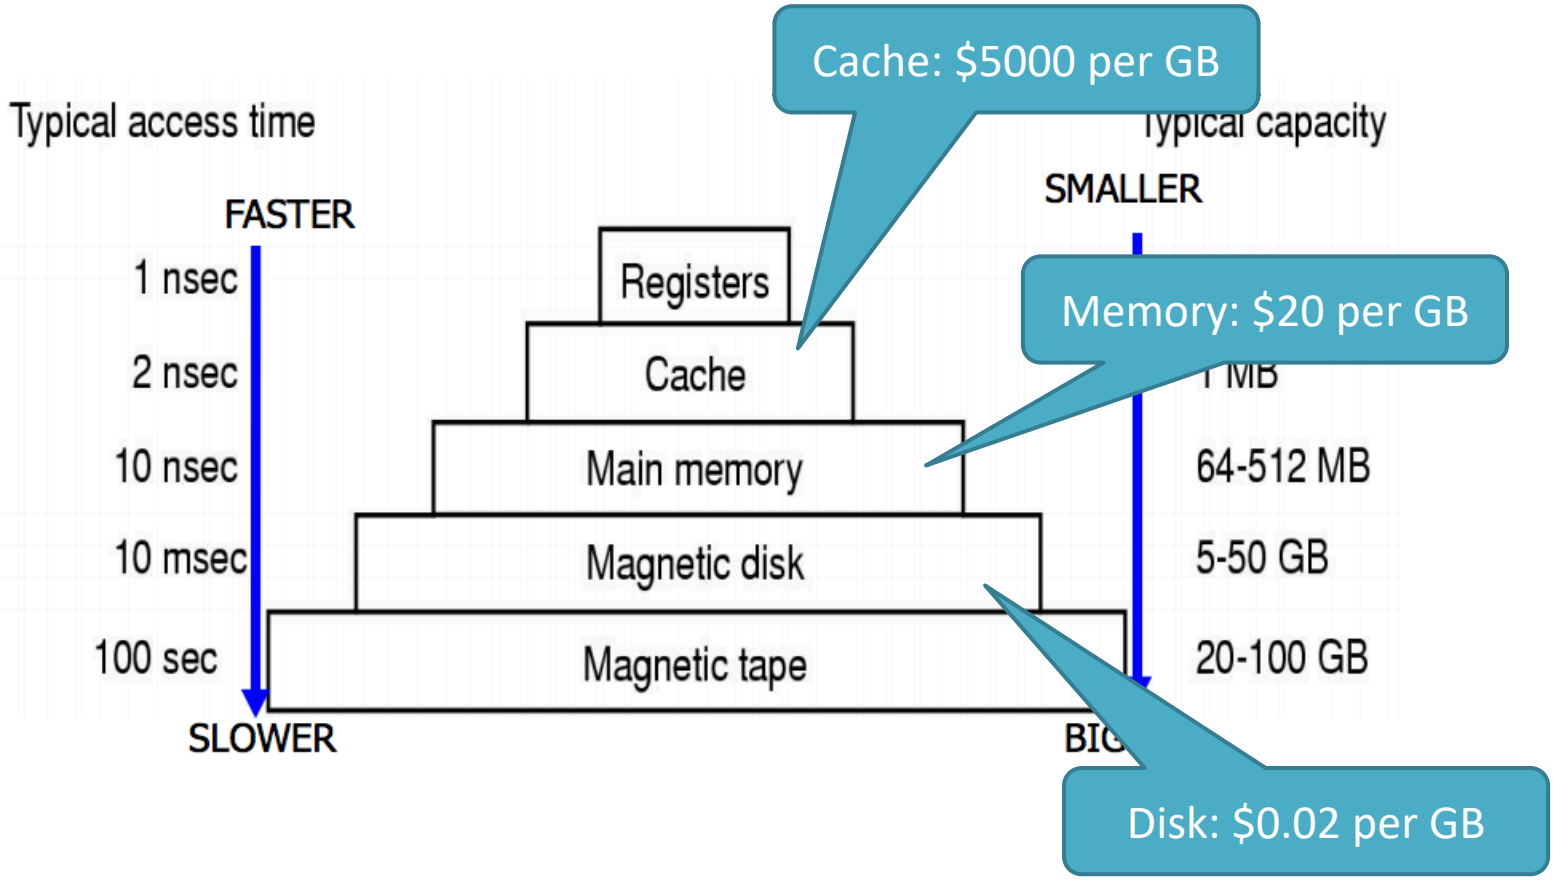


Single layer memory hierarchy?

Why we need memory hierarchy like this?

- Cost

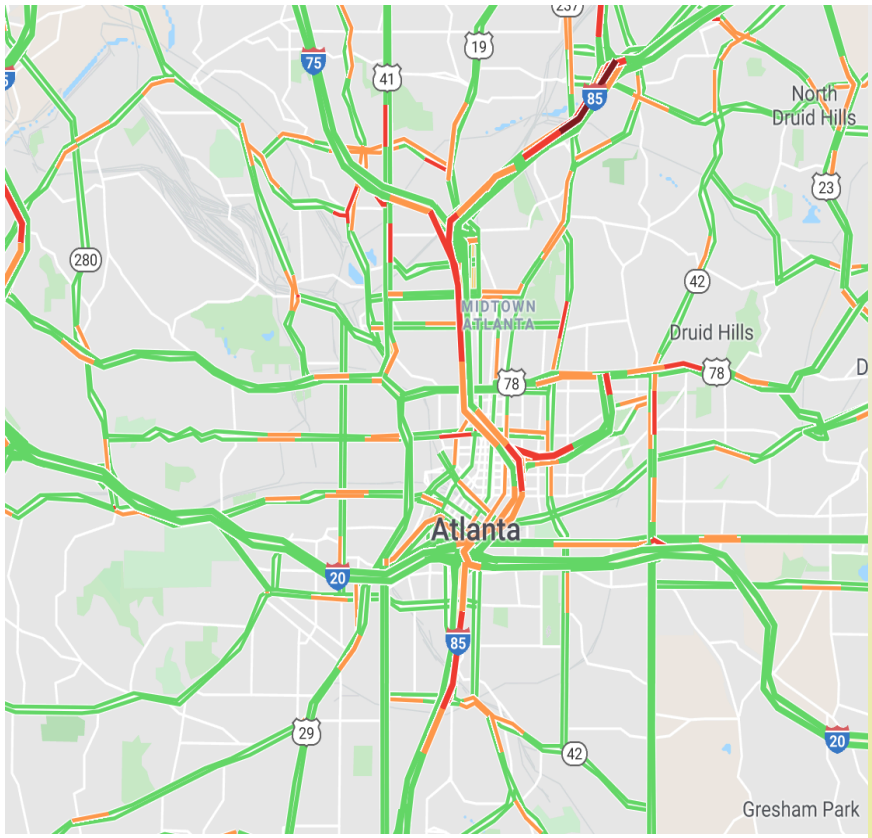
Year: 2010 data

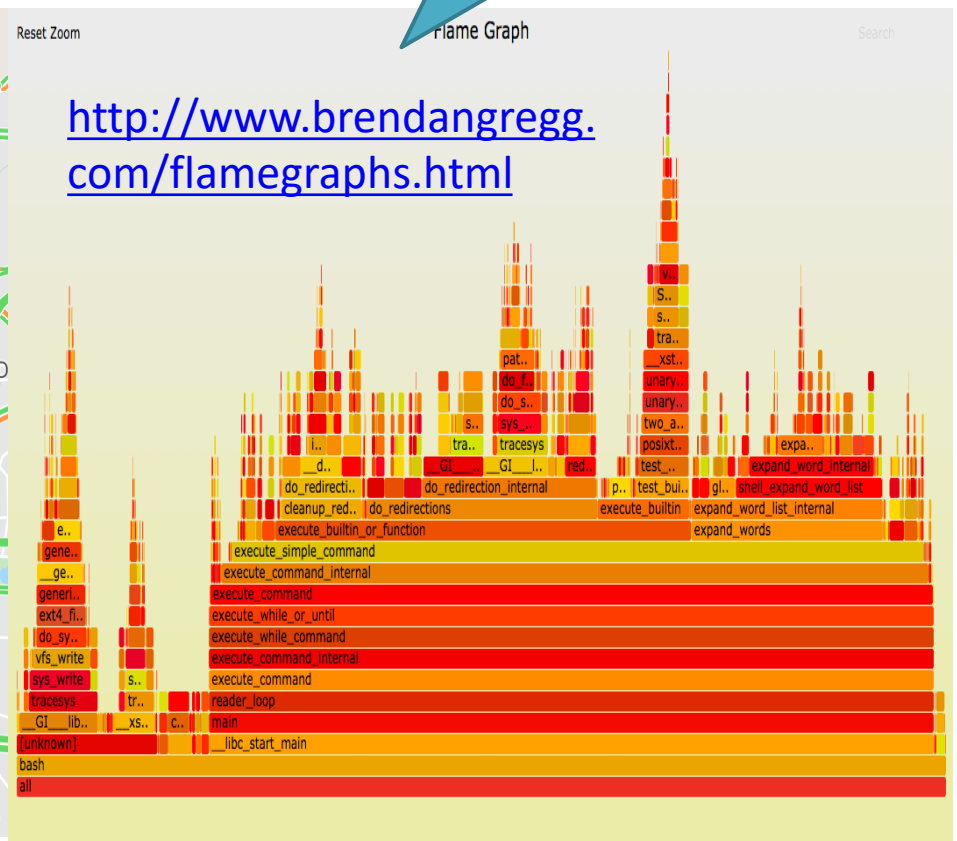


Why we need memory hierarchy like this?

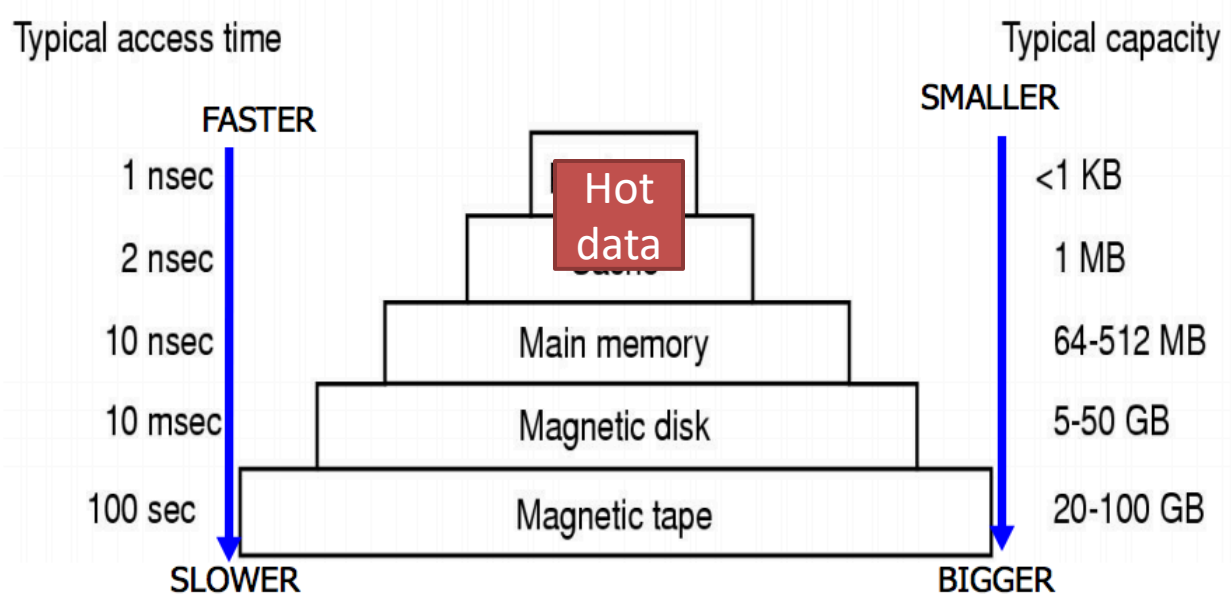
- 20/80 rule: only a small proportion of code/path is hot in programs

We only need to put the hot code inside the top hierarchy of memory





Why we need memory hierarchy like this?



Single layer memory hierarchy?

Outline

- Memory management overview
  - Why we need memory management?
  - Memory hierarchy?
  - What will memory management do?
  - What will happen when memory is not enough?
  - How to organize the memory?
- Memory management
  - Translation look-aside buffer
  - Page table
  - Multi-level page table

What will memory management do?

- Memory management key tasks:
  1. Allocate and de-allocate memory for processes (performed by OS and improve the programming efficiency)

```c
#include <stdio.h>
#include <stdlib.h>

int main()
{
    int n, i, *ptr, sum = 0;

    printf("Enter number of elements: ");
    scanf("%d", &n);

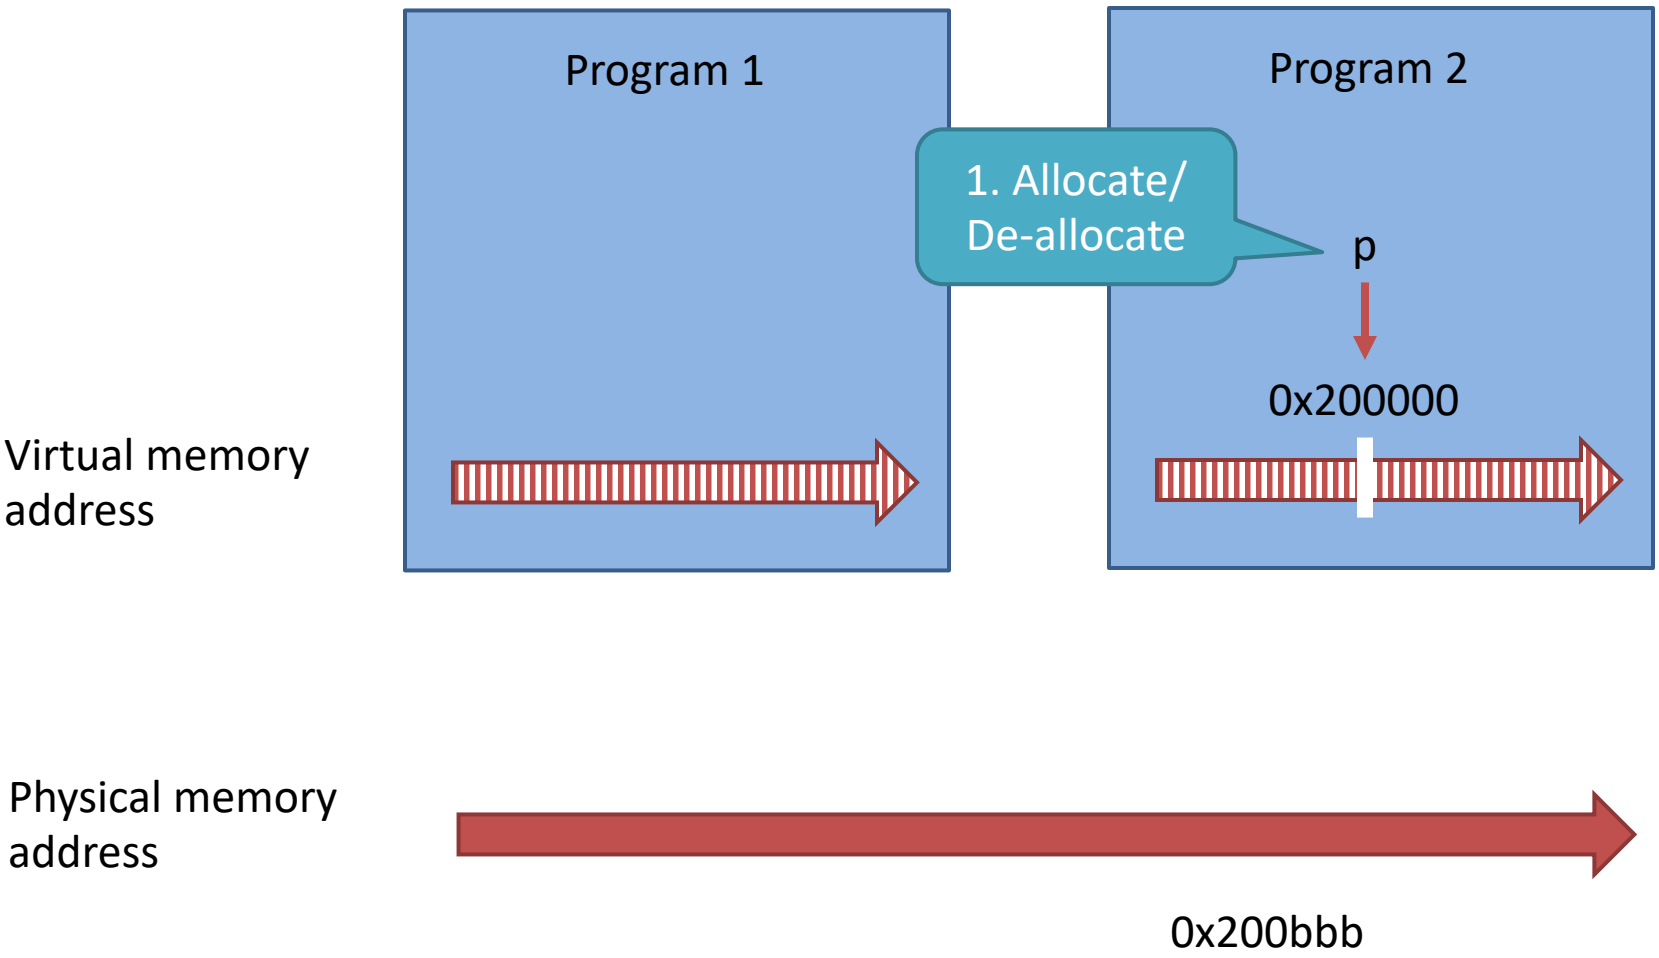
    ptr = (int*) malloc(n * sizeof(int));
```

```c
    printf("Sum = %d", sum);

    // deallocating the memory
    free(ptr);

    return 0;
}
```

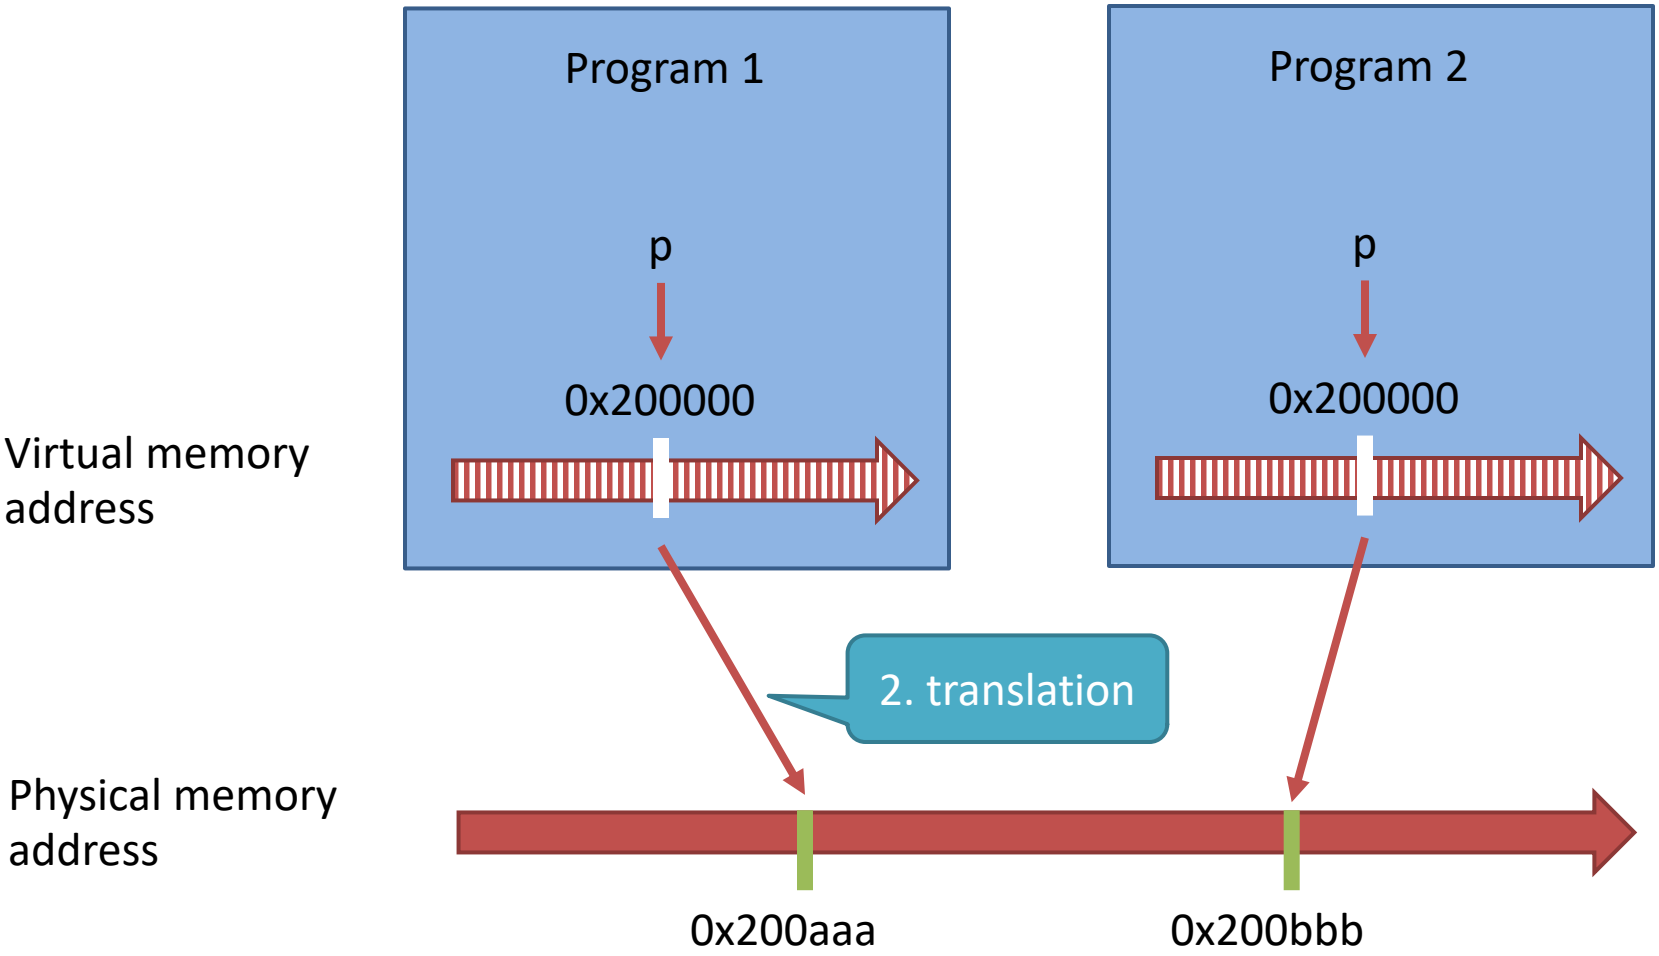
What will memory management do?



What will memory management do?

- Memory management key tasks:
  1. Allocate and de-allocate memory for processes (performed by OS and improve the programming efficiency)
  2. Address translation (e.g., between physical address and virtual address)

What will memory management do?

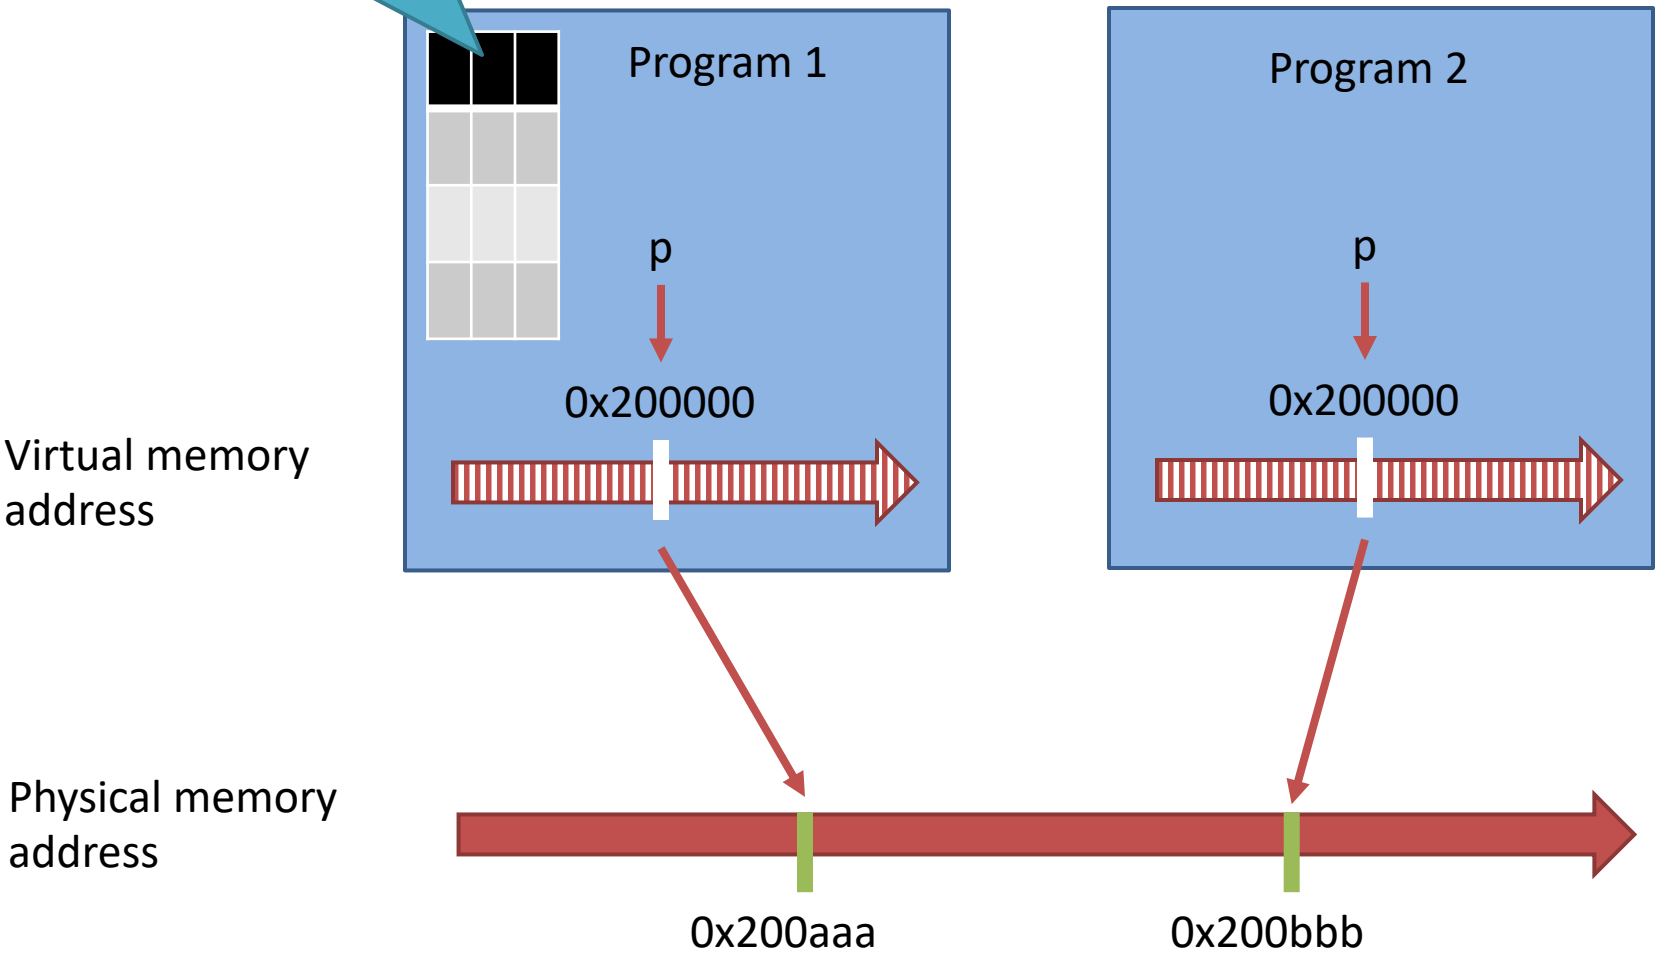


What will memory management do?

- Memory management key tasks:
  1. Allocate and de-allocate memory for processes (performed by OS and improve the programming efficiency)
  2. Address translation (e.g., between physical address and virtual address)
  3. Keep track of used memory size and used by whom

memory management do?

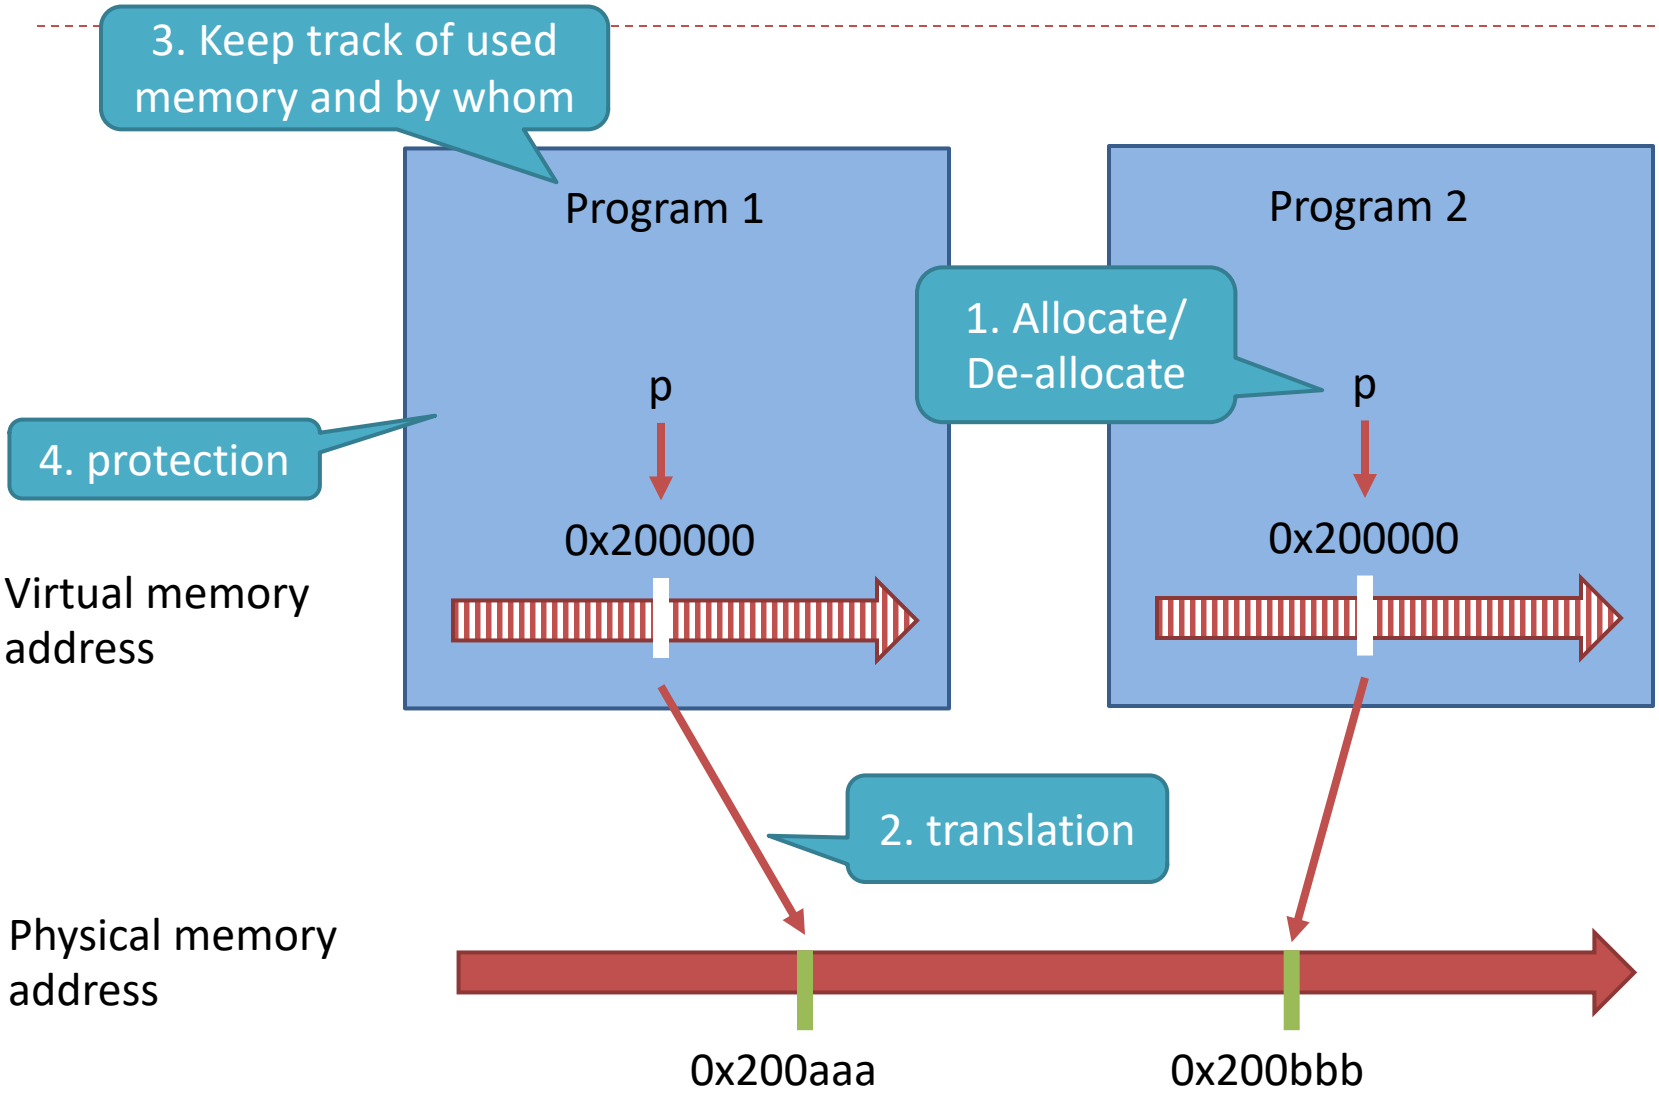
3. Keep track of used memory and by whom
(try: nmon, then press "t")



What will memory management do?

- Memory management key tasks:
  1. Allocate and de-allocate memory for processes (performed by OS and improve the programming efficiency)
  2. Address translation (e.g., between physical address and virtual address)
  3. Keep track of used memory size and used by whom
  4. Memory protection

What will memory management do?

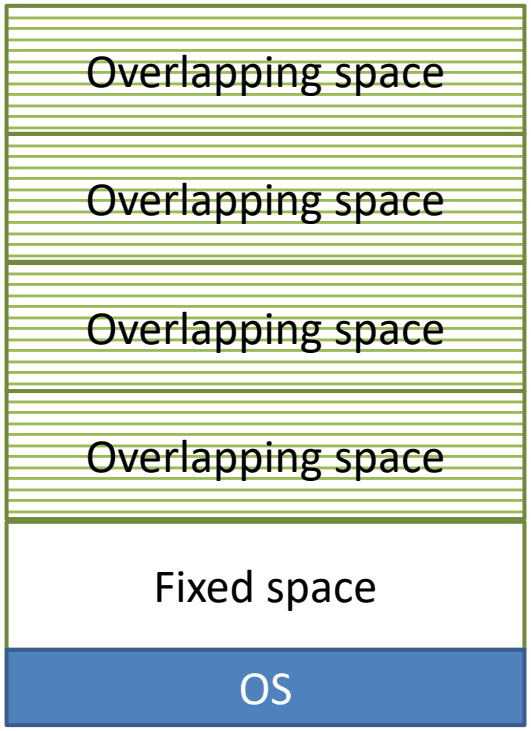


Outline

- Memory management overview
  - Why we need memory management?
  - Memory hierarchy?
  - What will memory management do?
  - What will happen when memory is not enough?
  - How to organize the memory?
- Memory management
  - Translation look-aside buffer
  - Page table
  - Multi-level page table

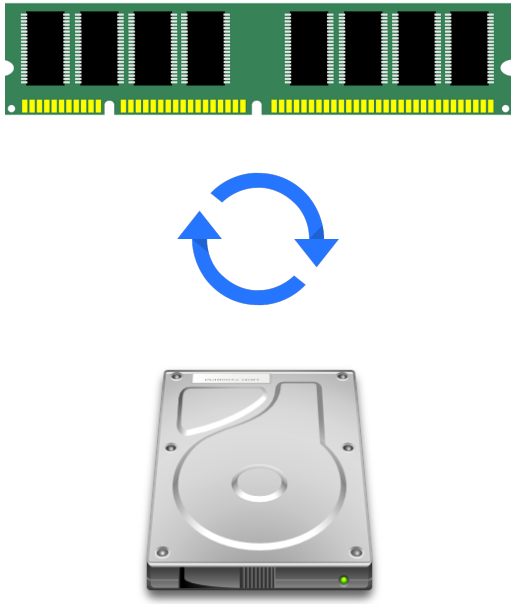
What will happen when memory is not enough?

- Overlapping
  - Memory is small and cannot hold all program data
  - User space is divided to one fixed space and several overlapping space
  - Fixed space: hold most frequent data
  - Overlapping space: the data will overlap those which never be used (after overlapping, data is gone)

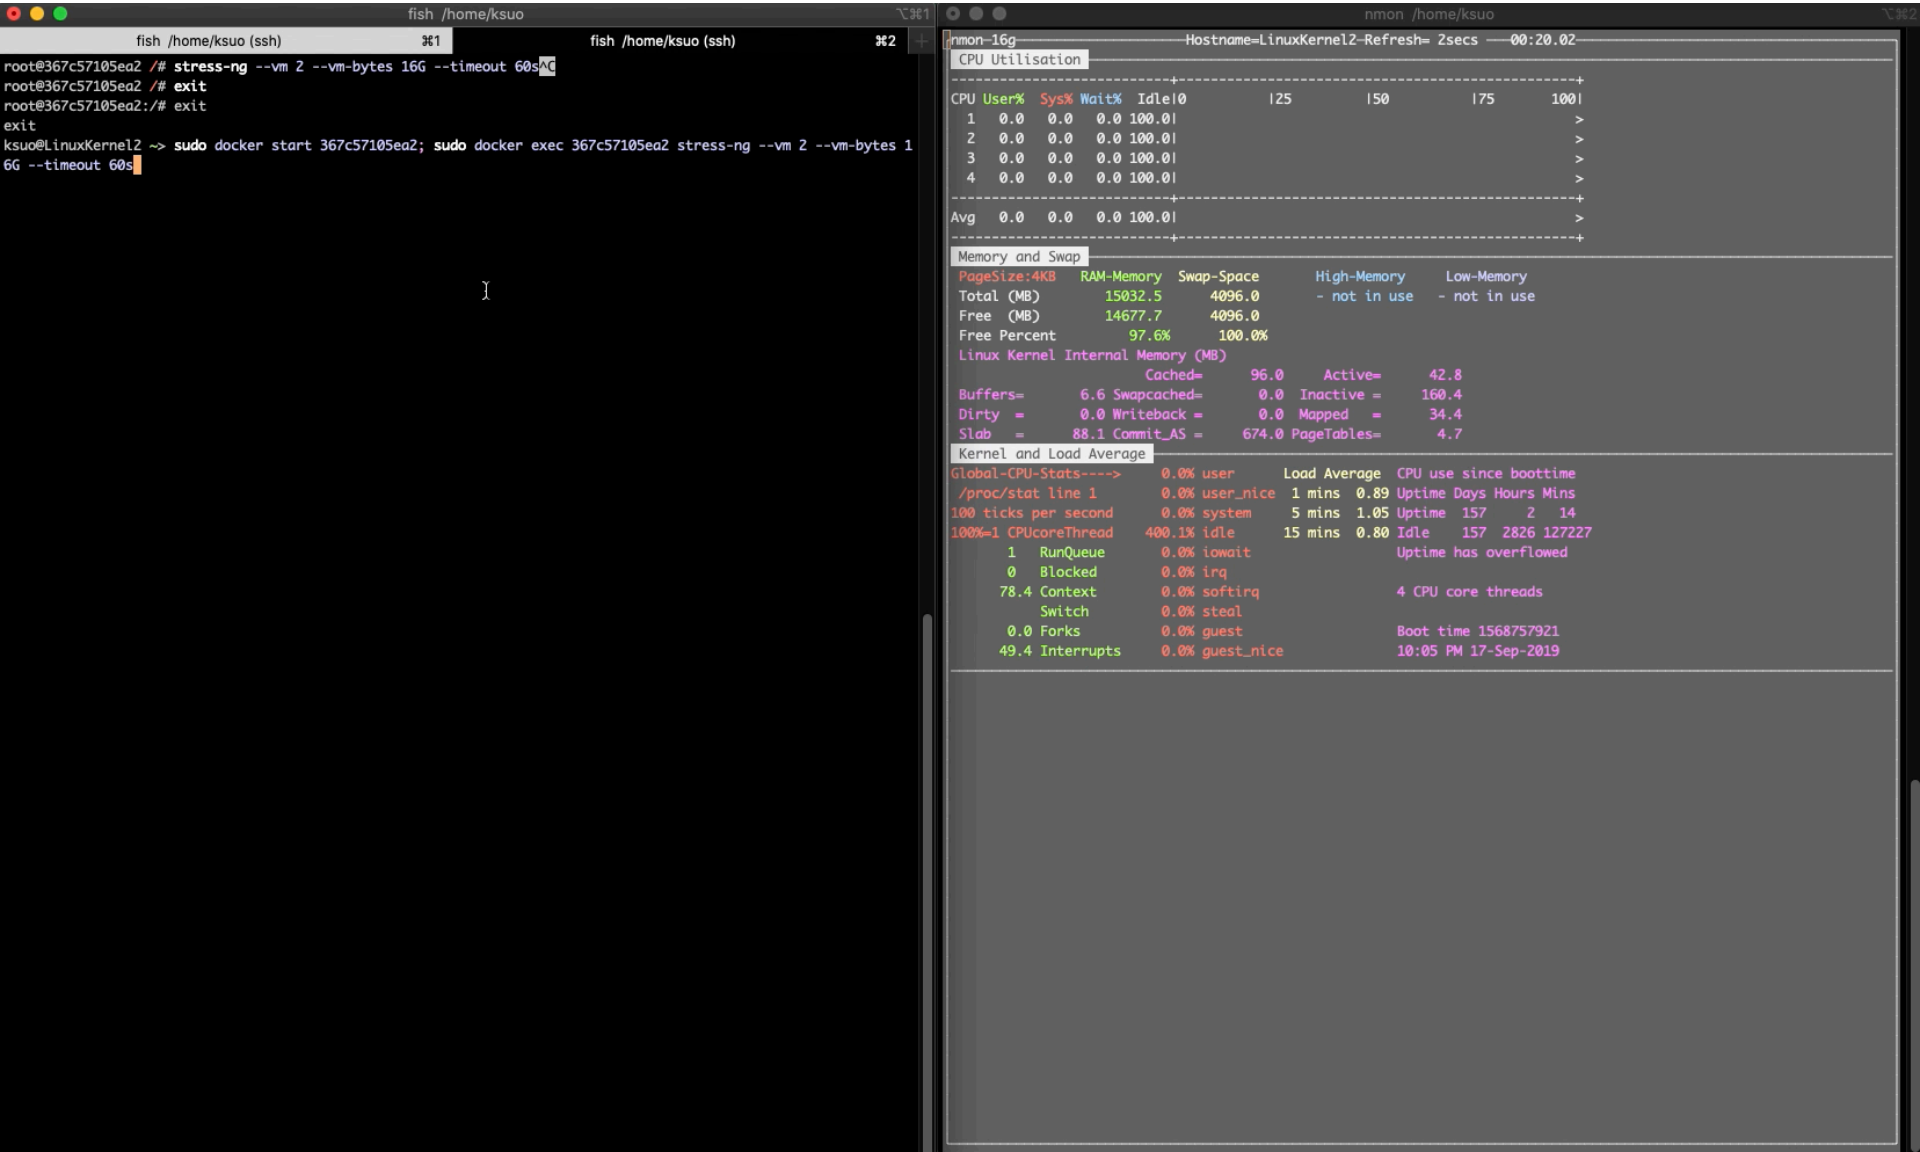


What will happen when memory is not enough?

- Swapping
  - Leave memory and are swapped out to disk (data still there)
  - Re-enter memory by getting swapped in from disk

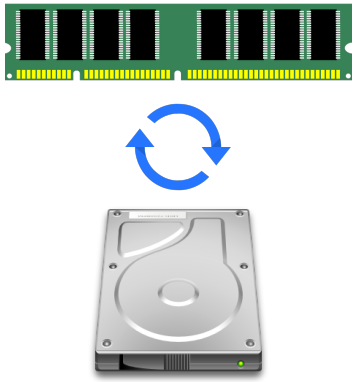


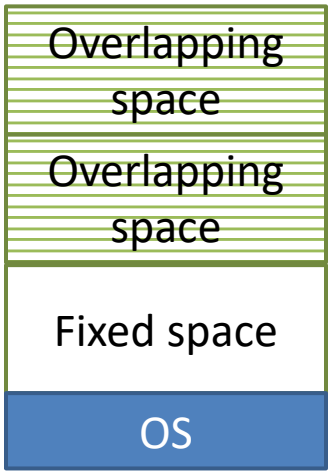
What will happen when memory is not enough?



What will happen when memory is not enough?

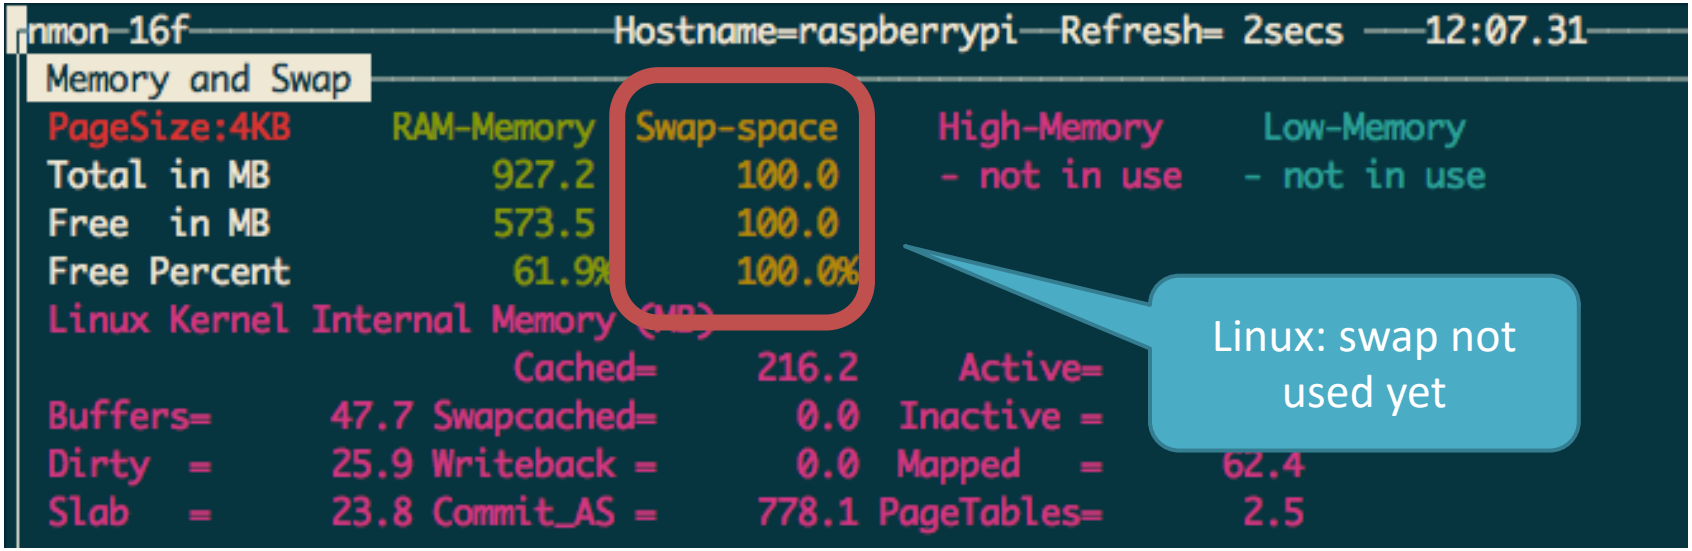
- Difference
  - Swapping is used for different processes while overlapping is used for one program/process (for security, otherwise causing app crash)
  - Swapping is still widely used today while overlapping is not



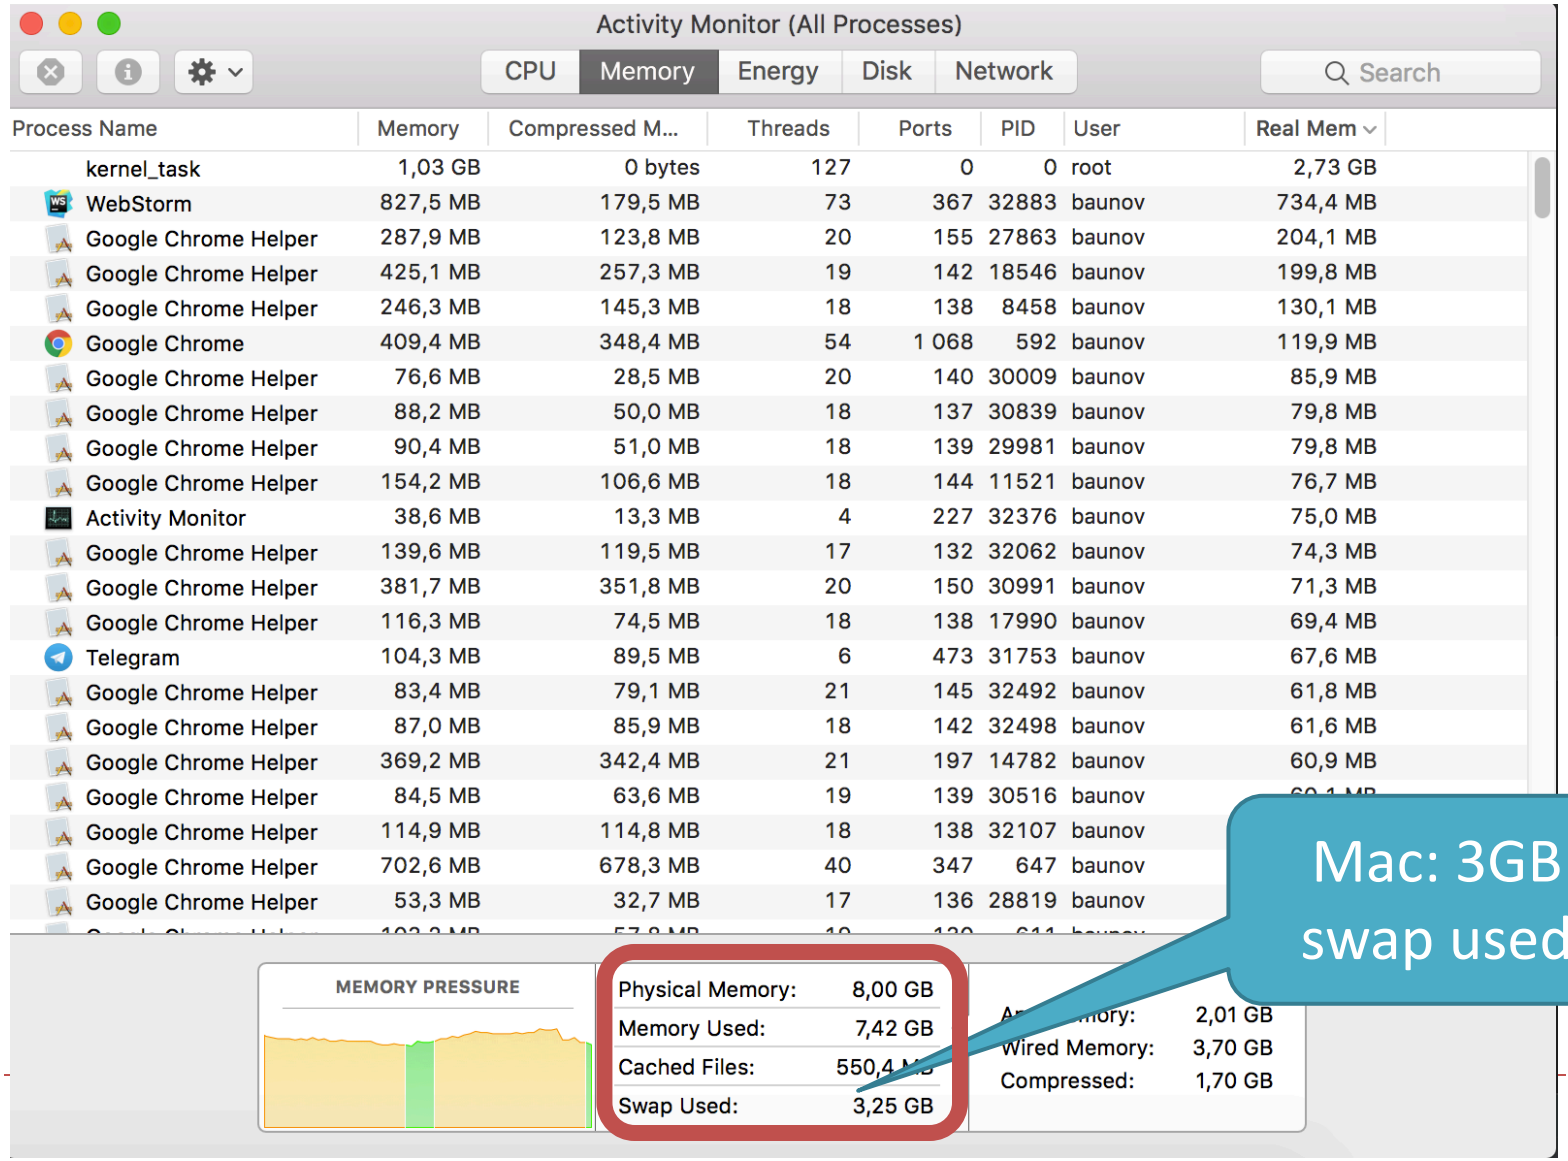


Swap example in Linux

- $ nmon, then press ‘m’ to check statistics from memory



Swap example in Mac

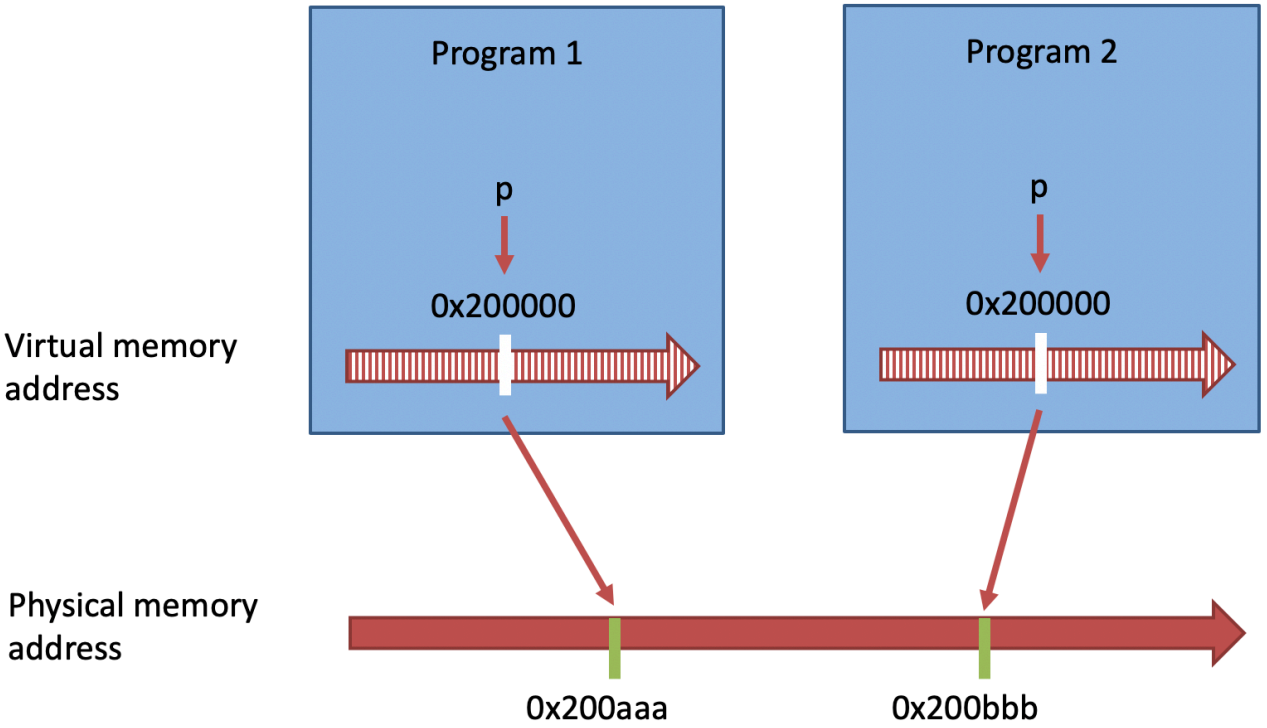


Outline

- Memory management overview
  - Why we need memory management?
  - Memory hierarchy?
  - What will memory management do?
  - What will happen when memory is not enough?
  - How to organize the memory?
- Memory management
  - Translation look-aside buffer
  - Page table
  - Multi-level page table

Memory Abstraction

- Program should have their own views of memory
  - The address space – logical address → easy to use
  - Non-overlapping address spaces – protection → secure
  - Move a program by mapping its addresses to a different place → relocation



Physical address vs. Virtual address

- Virtual address: A memory address that an operating system allows a process to use **(Program view)**

- Physical address: A unit address for memory chip level that corresponds to the address bus to which the processor and CPU are connected **(OS view)**

```c
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char *argv[])
{
        int x = 3;

        printf("location of code : %p\n", (void *) main);
        printf("location of heap : %p\n", (void *) malloc(1));
        printf("location of stack : %p\n", (void *) &x);

        return 0;
}
```

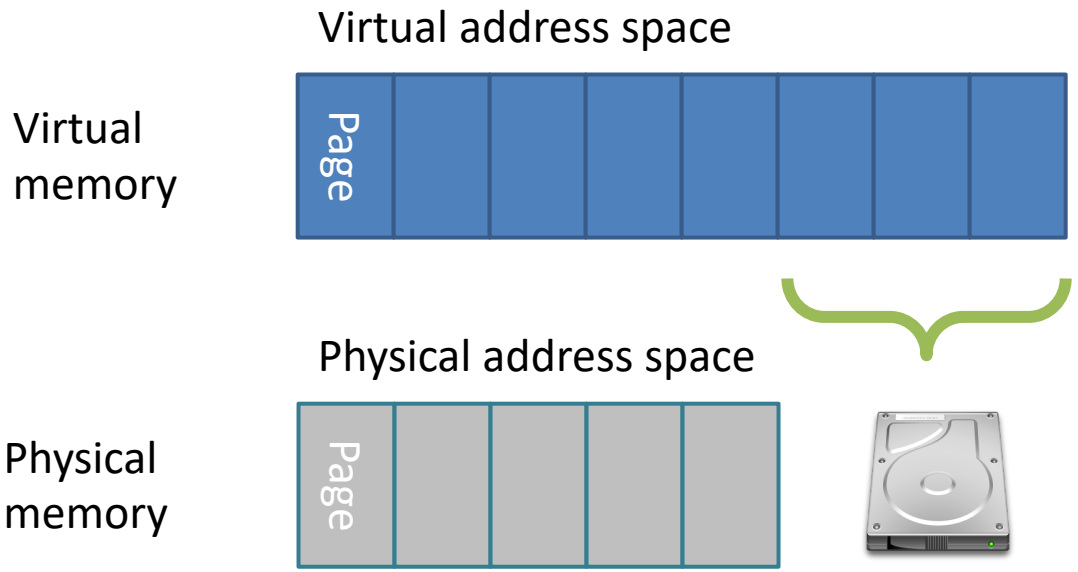
All virtual addresses (program view)

```
pi@raspberrypi ~> ./test.o
location of code : 0x10470
location of heap : 0x156a410
location of stack : 0x7ef381c4
```

Physical memory vs. Virtual memory

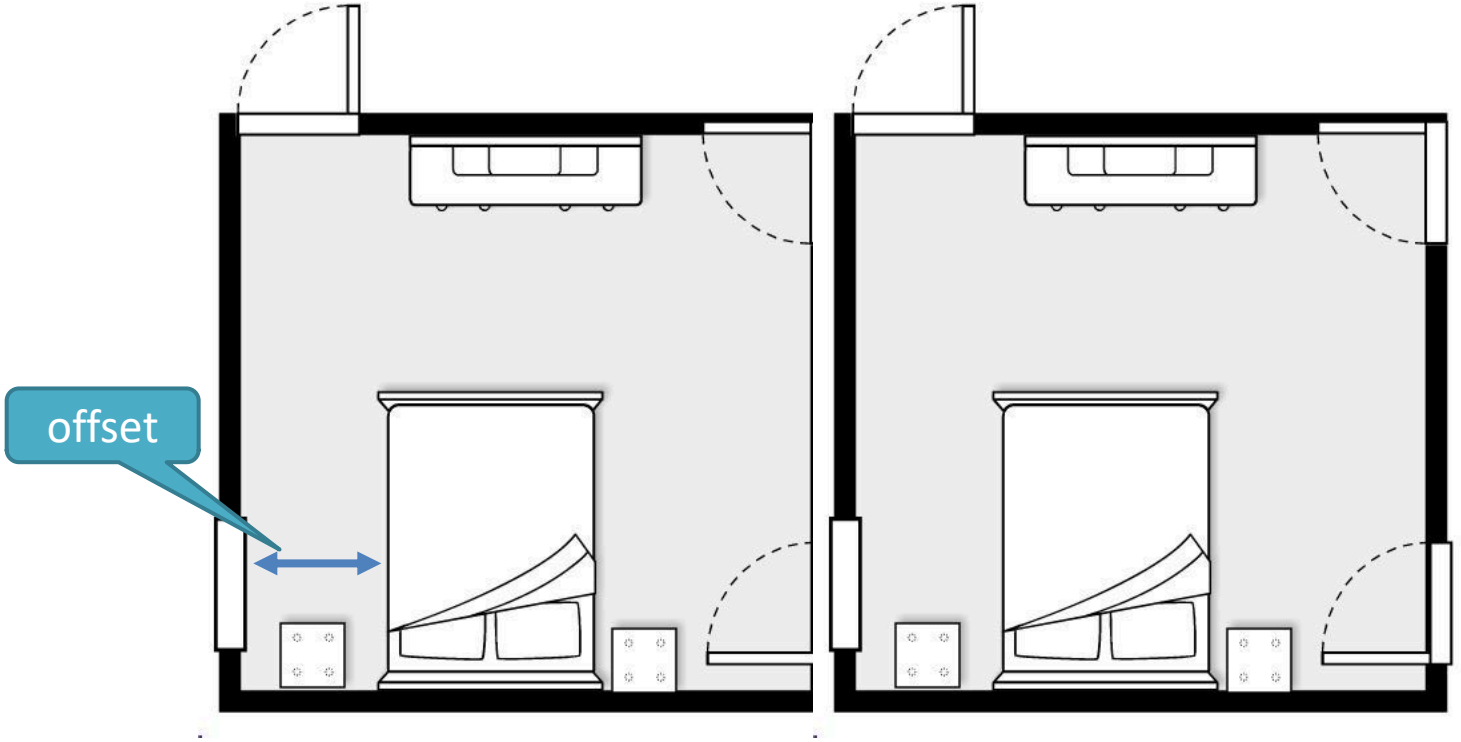
- Virtual memory: the combined size of the program, data, and stack **may exceed** the amount of physical memory available (due to swapping).

- Memory is divided into pages and OS decides which pages stay in **memory** and which get moved to **disk**.



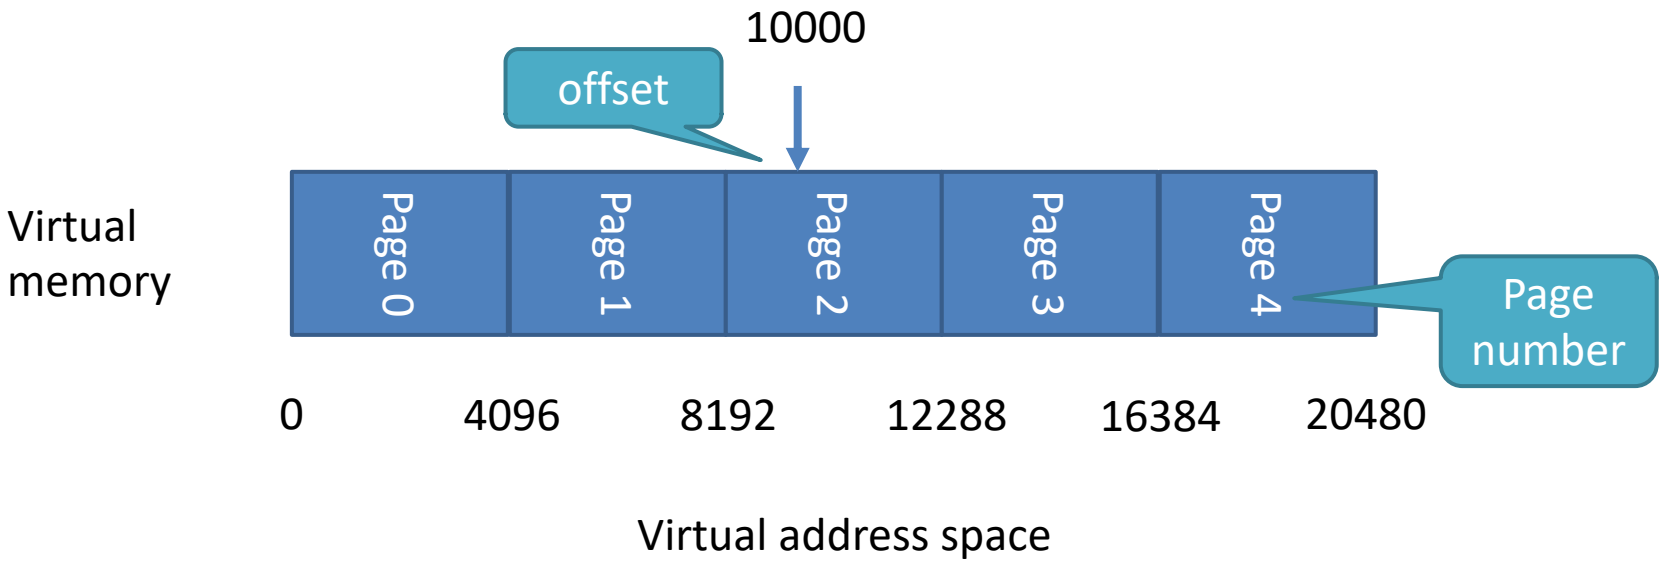
How to organize memory? Page number and offset

How to organize memory? Page number and offset



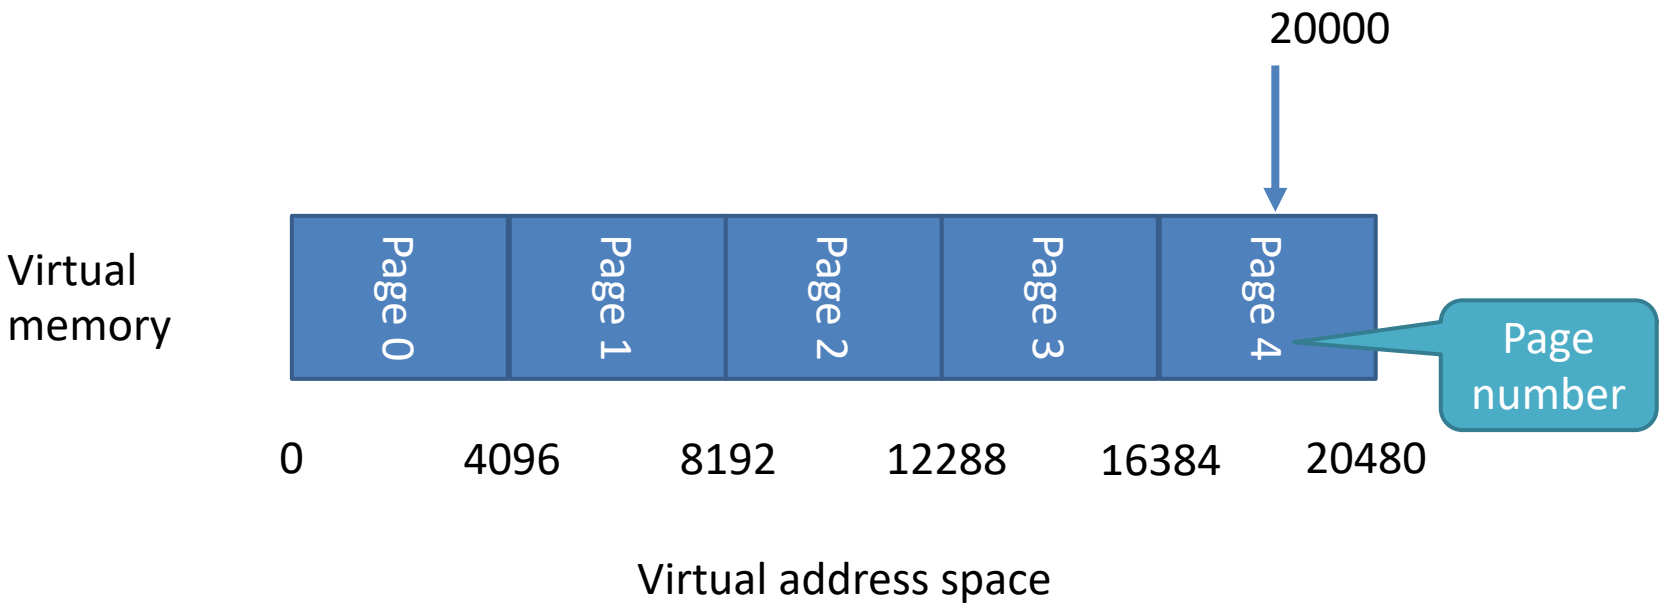
How to organize memory? Page number and offset

- Virtual address
  - *Page number: which page the address is in*
  - *Page offset: the distance between this address and the start of that page*



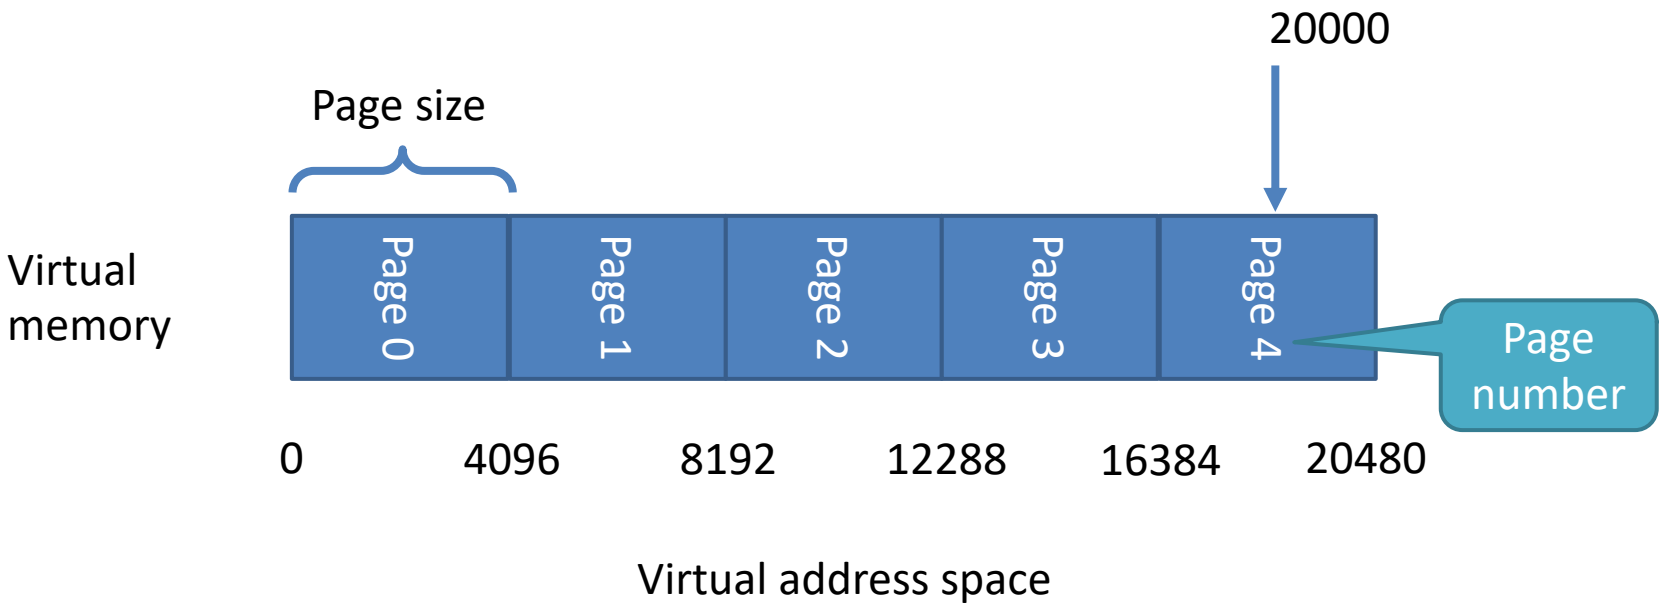
How to organize memory? Page number and offset

- Suppose the page size is 4KB, the address is 20000
  - The virtual page number is *20000/4096 = 4*



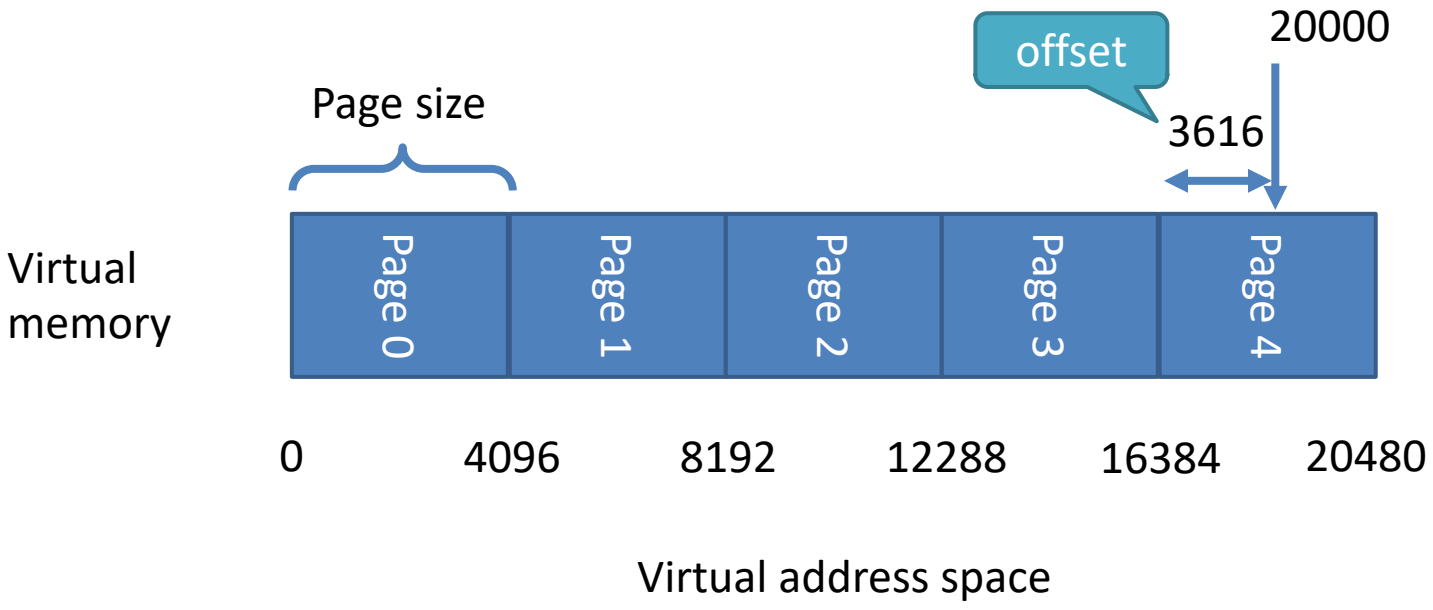
How to organize memory? Page number and offset

- Suppose the page size is 4KB, the address is 20000
  - **page number = address / page size**



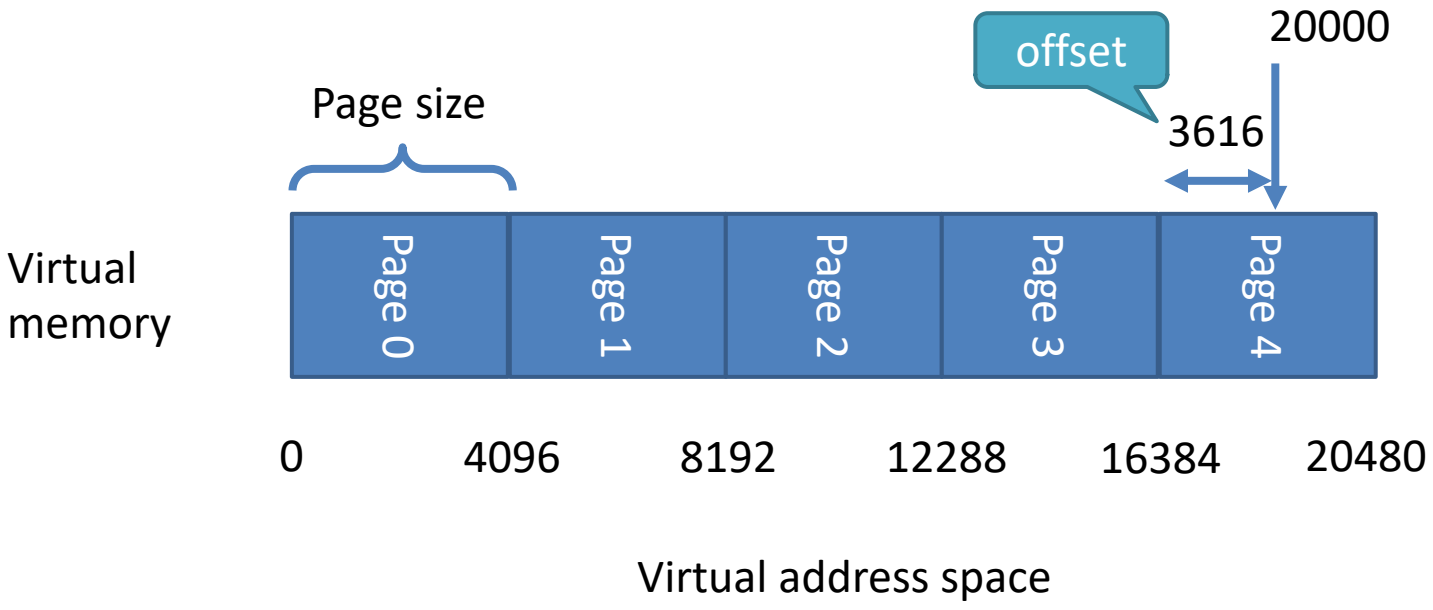
How to organize memory? Page number and offset

- Suppose the page size is 4KB, the address is 20000
  - The offset is *20000 % 4096 = 3616*



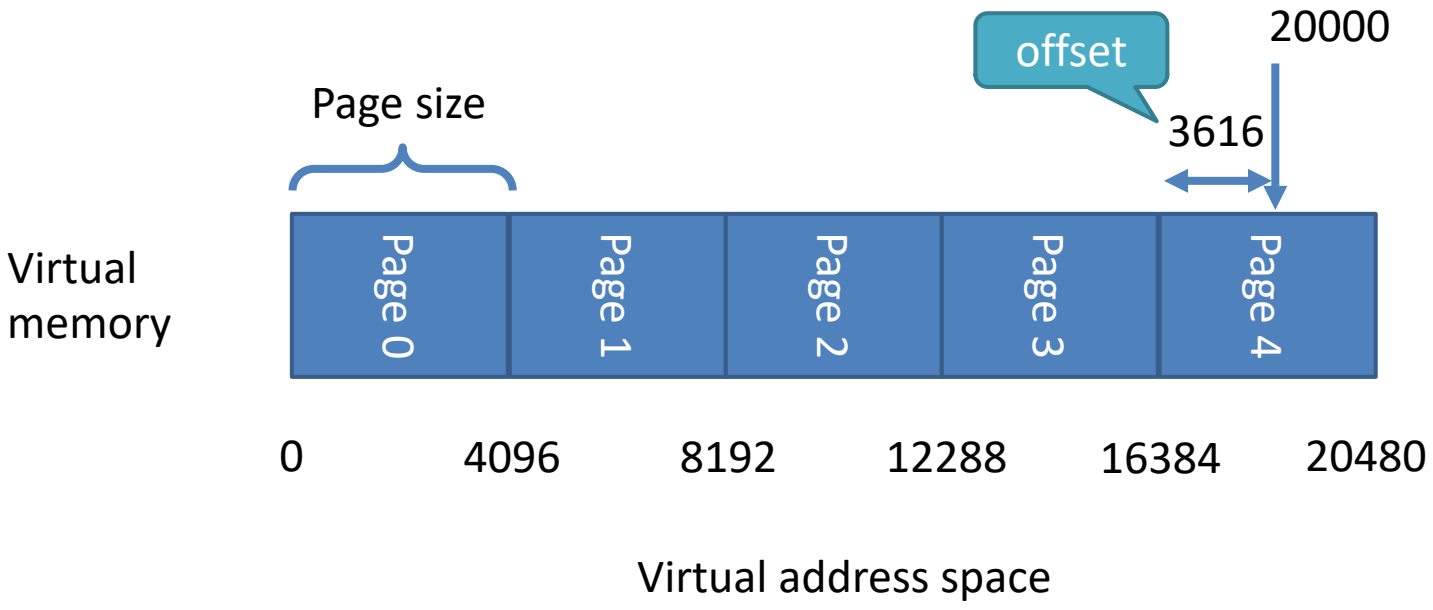
How to organize memory? Page number and offset

- Suppose the page size is 4KB, the address is 20000
  - **offset = address % page size**



How to organize memory? Page number and offset

- Suppose the page size is 4KB, the address is 20000
  - **page number = address / page size**
  - **offset = address % page size**



Question

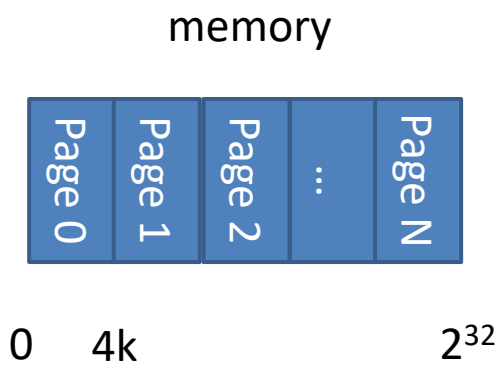
- Consider a machine that has a 32-bit virtual address space and 4K Byte page size.

1. What is the memory size?

(32-bit can represent how many different numbers?)

2^{32} = 4GB

//2^{10} = 1KB, 2^{20} = 1MB, 2^{30} = 1GB



Question

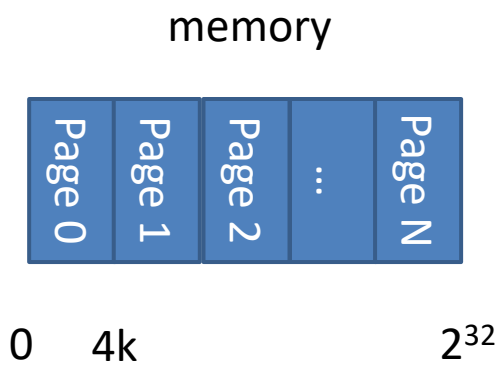
- Consider a machine that has a 32-bit virtual address space and 4K Byte page size.

2. How many virtual pages could a process have?

The total memory is 4GB

The single page size is 4KB

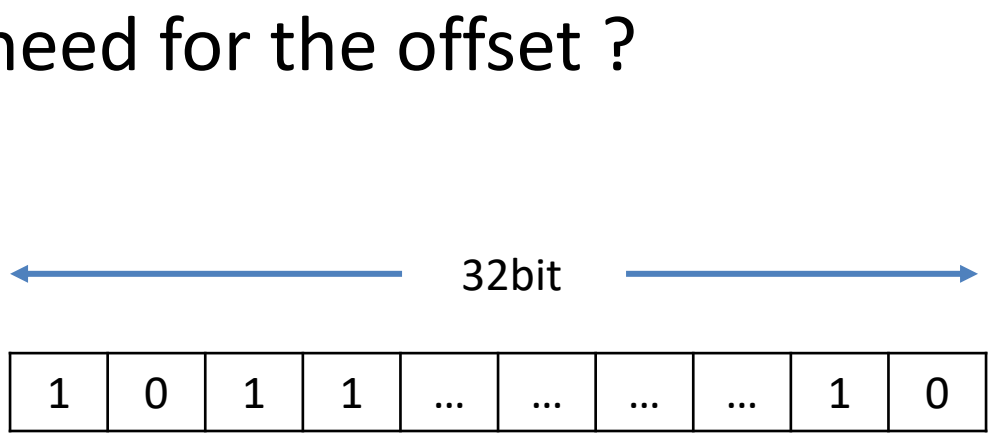
So the page number = 4GB/4KB = 2^{20}

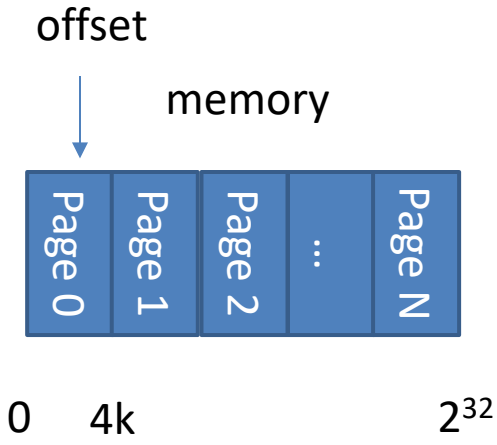


Question

- Consider a machine that has a 32-bit virtual address space and 4K Byte page size.

3. Given a 4KB page, how many address bits do we need for the offset ?



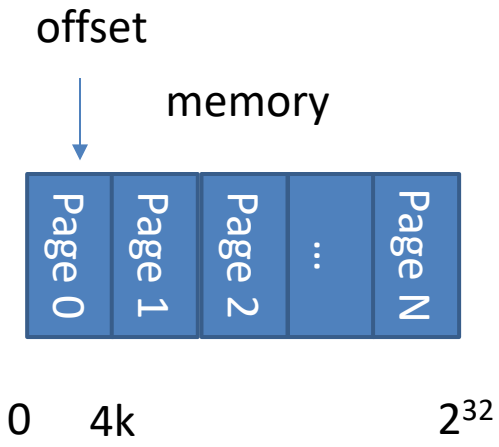


Question

- Consider a machine that has a 32-bit virtual address space and 4K Byte page size.

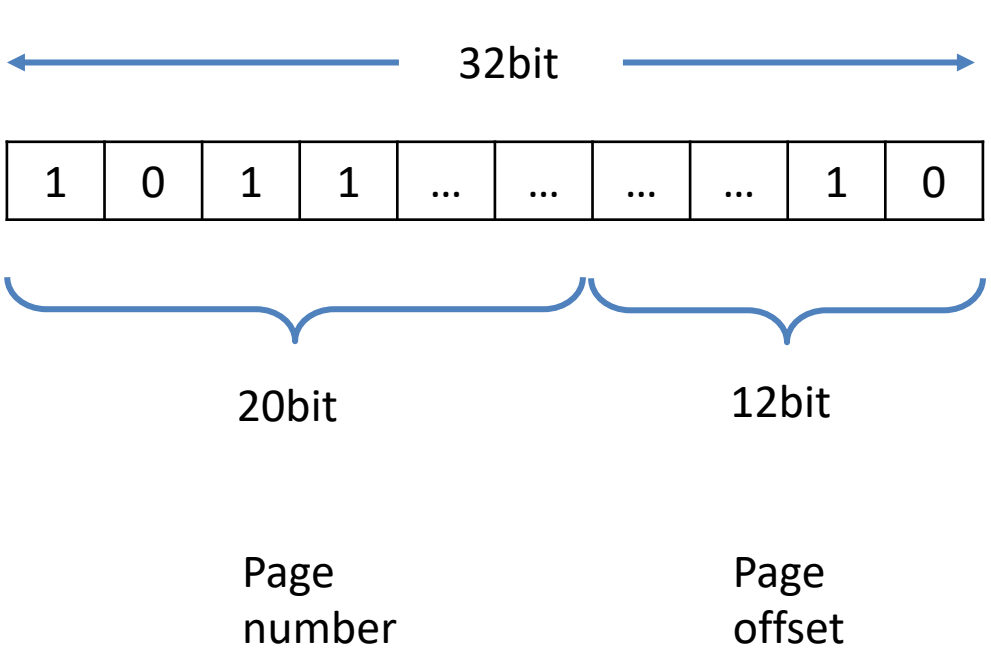
3. Given a 4KB page, how many address bits do we need for the offset ?

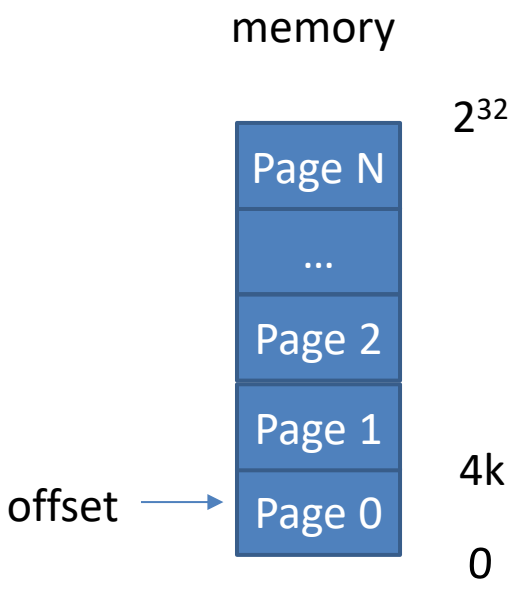
$Log_2(4KB) = Log_2(2^{12}) = 12$



Question

- Consider a machine that has a 32-bit virtual address space and 4K Byte page size.





Question

- Consider a machine that has a 32-bit virtual address space and 8KByte page size.

1. What is the total size of the memory (virtual address) space?

Total size (in bytes) of the virtual address space for each process
= 2^{32} = 4 * 1024 * 1024 *1024 bytes
= 4 GB

Question

- Consider a machine that has a 32-bit virtual address space and 8KByte page size.

2. How many bits in a 32-bit address are needed to determine the page number of the address?

Number of pages in virtual address space = 4GB/8KB = 512*1024 = $2^9*2^{10} = 2^{19}$

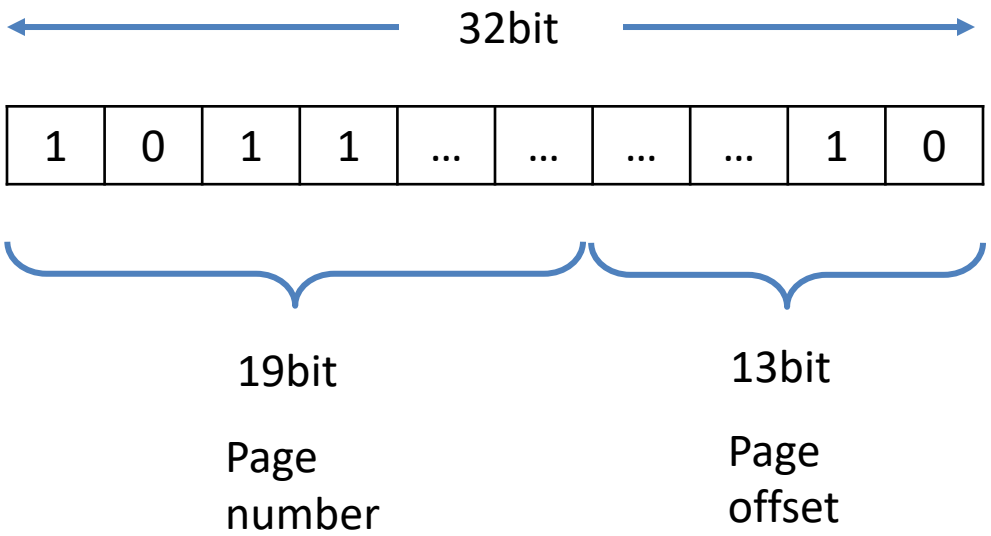
So the number of bits in a 32-bit address are needed to determine the page number of the address is 19 bits

Question

- Consider a machine that has a 32-bit virtual address space and 8KByte page size.

3. How many bits in a 32-bit address represent the byte offset into a page?

32 – 19 = 13 bits

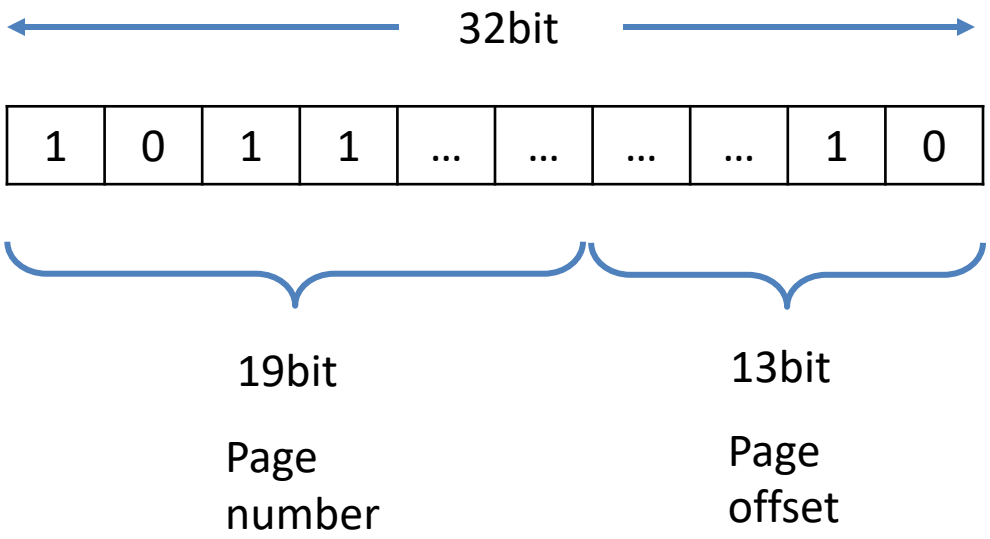


Question

- Consider a machine that has a 32-bit virtual address space and 8KByte page size.

4. How many page-table entries or how many pages we have?

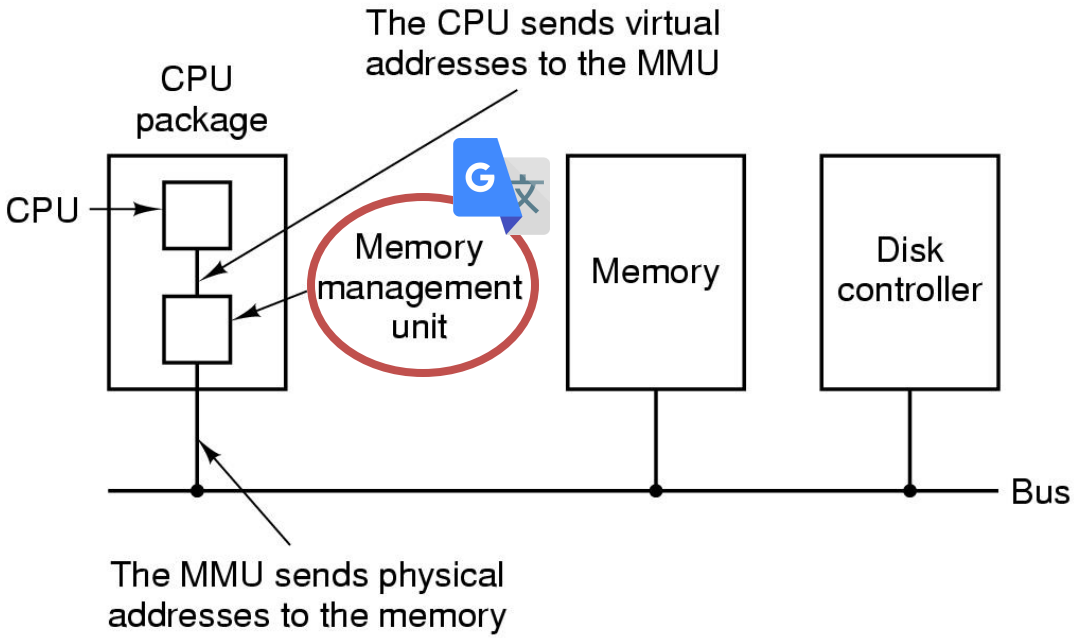
Number of PTEs
= Number of pages in virtual address
= 4GB/8KB
= 2^{19} pages



Outline

- Memory management overview
  - Why we need memory management?
  - Memory hierarchy?
  - What will memory management do?
  - What will happen when memory is not enough?
  - How to organize the memory?
- Memory management
  - Translation look-aside buffer
  - Page table
  - Multi-level page table

Physical and virtual address translation

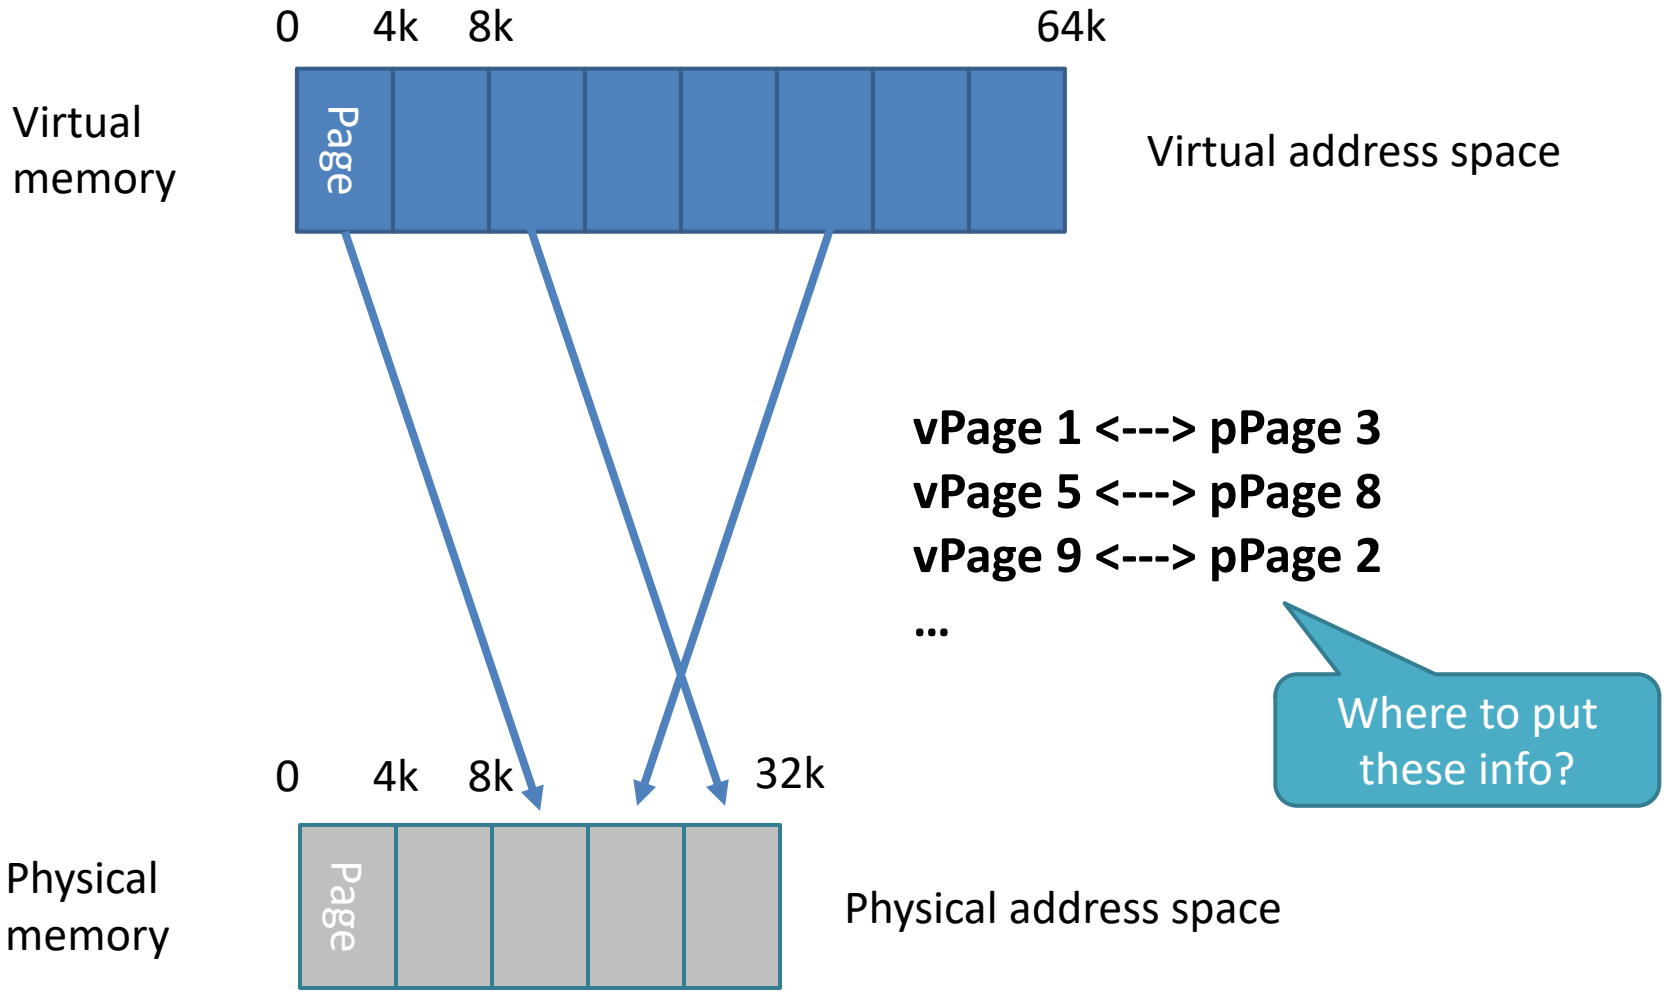


Logical program works in its contiguous virtual address space

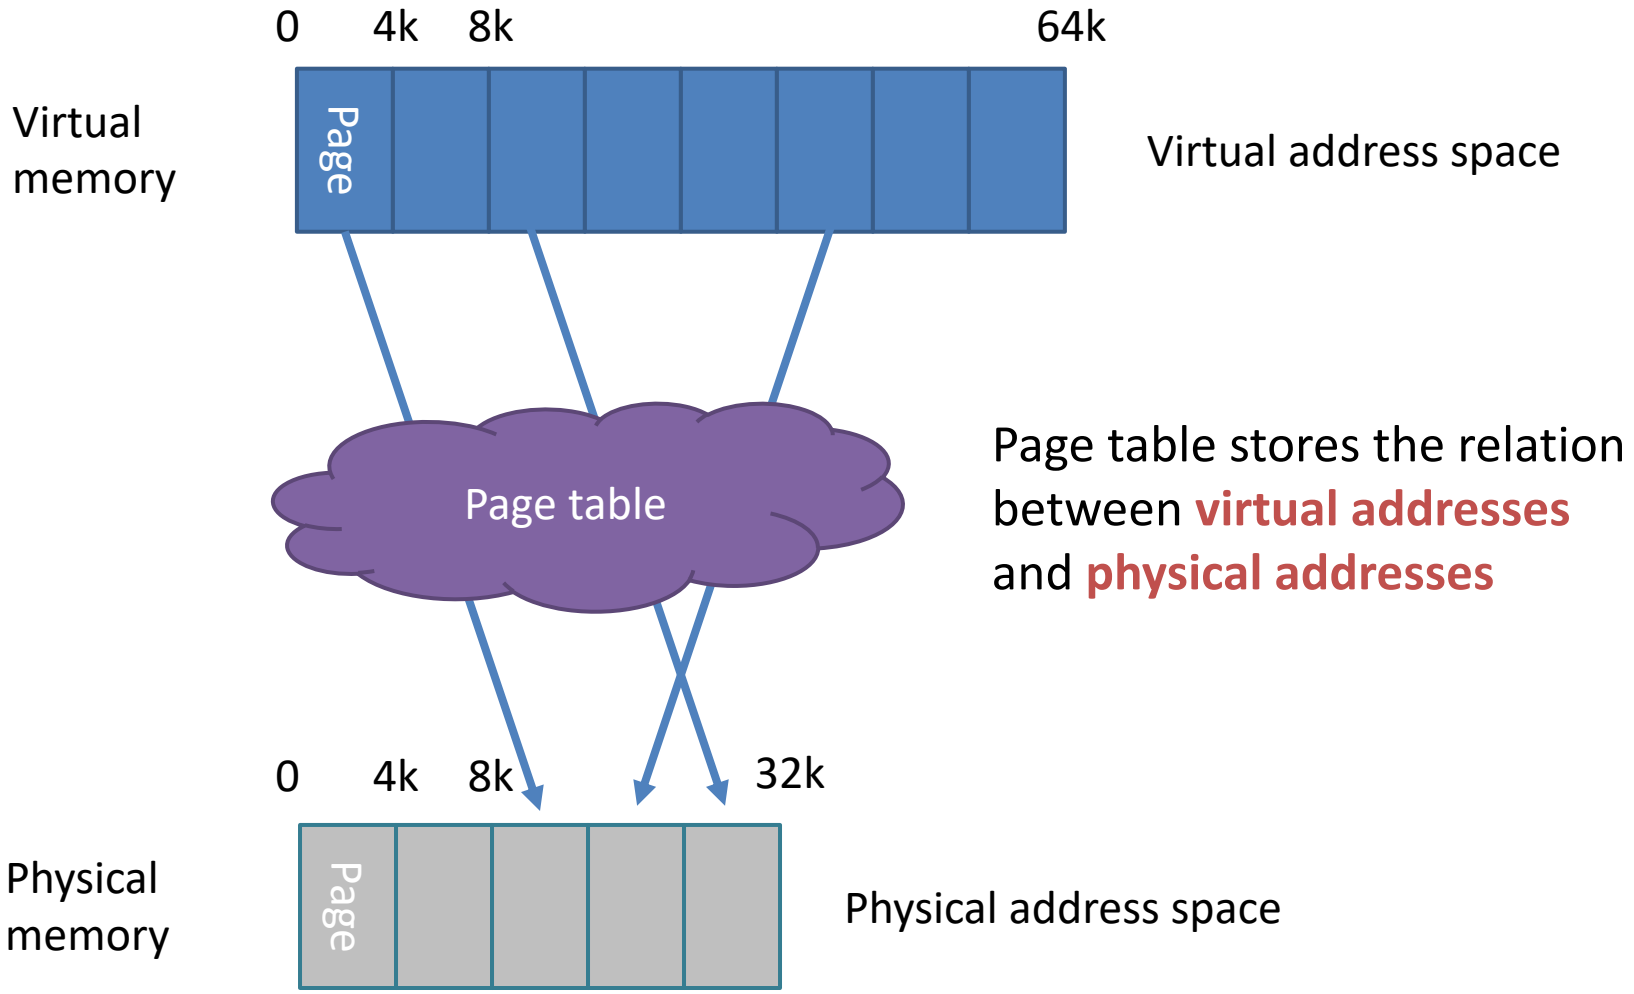
Address translation done by MMU

Actual locations of the data in physical memory

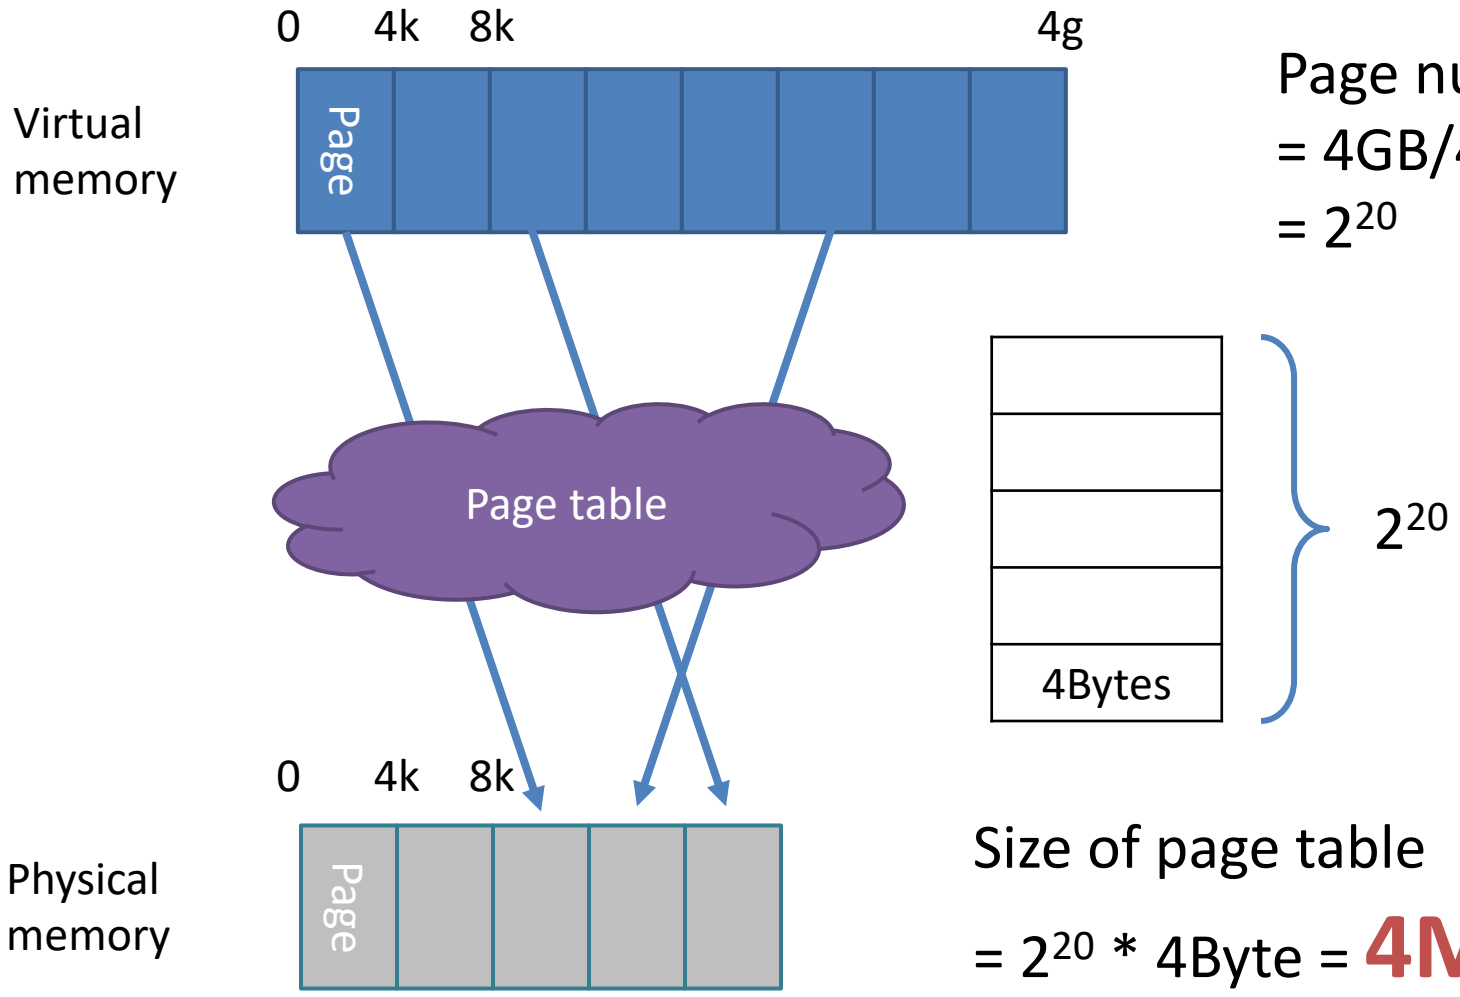
Page and page table



Page and page table



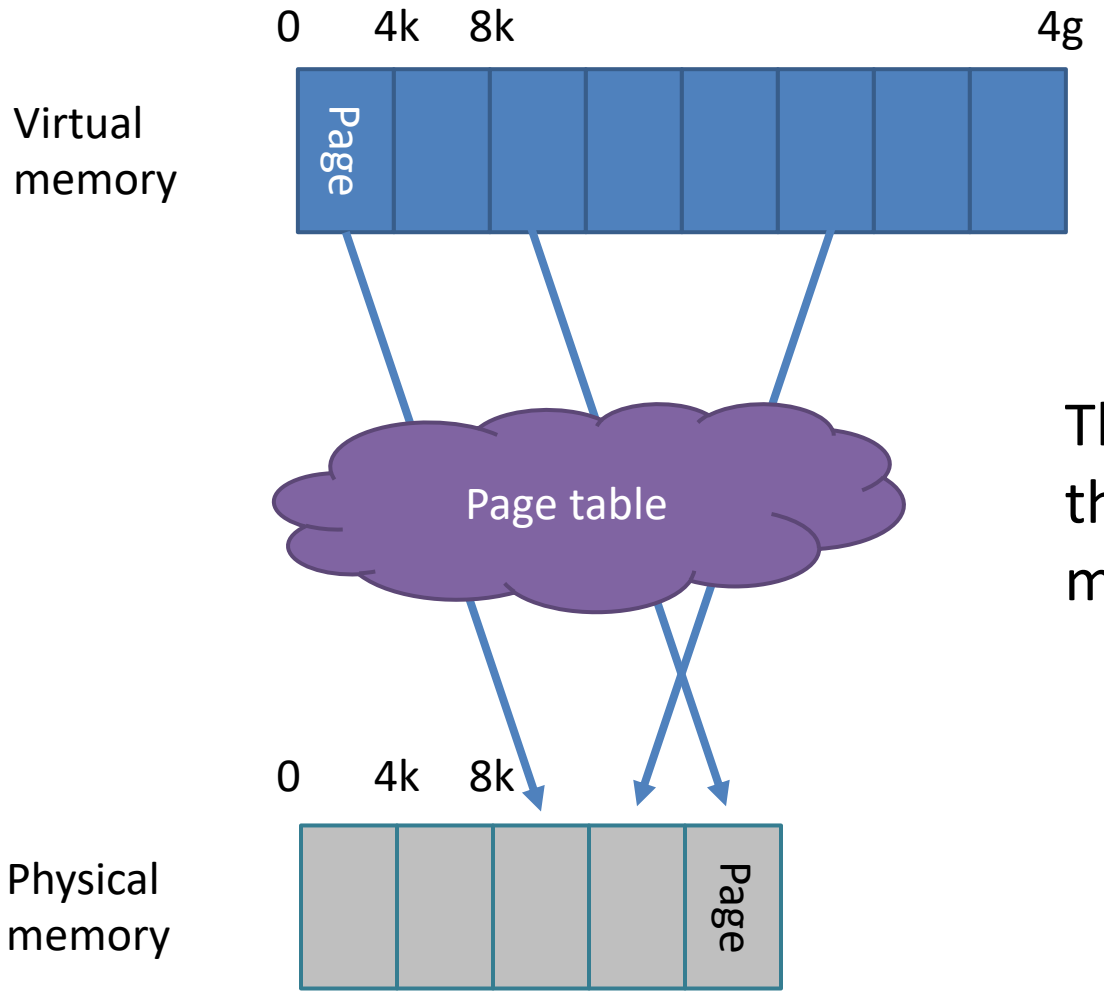
Suppose virtual address is 4GB and page size is 4KB. The page table item is 4 Byte. What would be the size of page table?



Page number
= 4GB/4KB
= 2^{20}

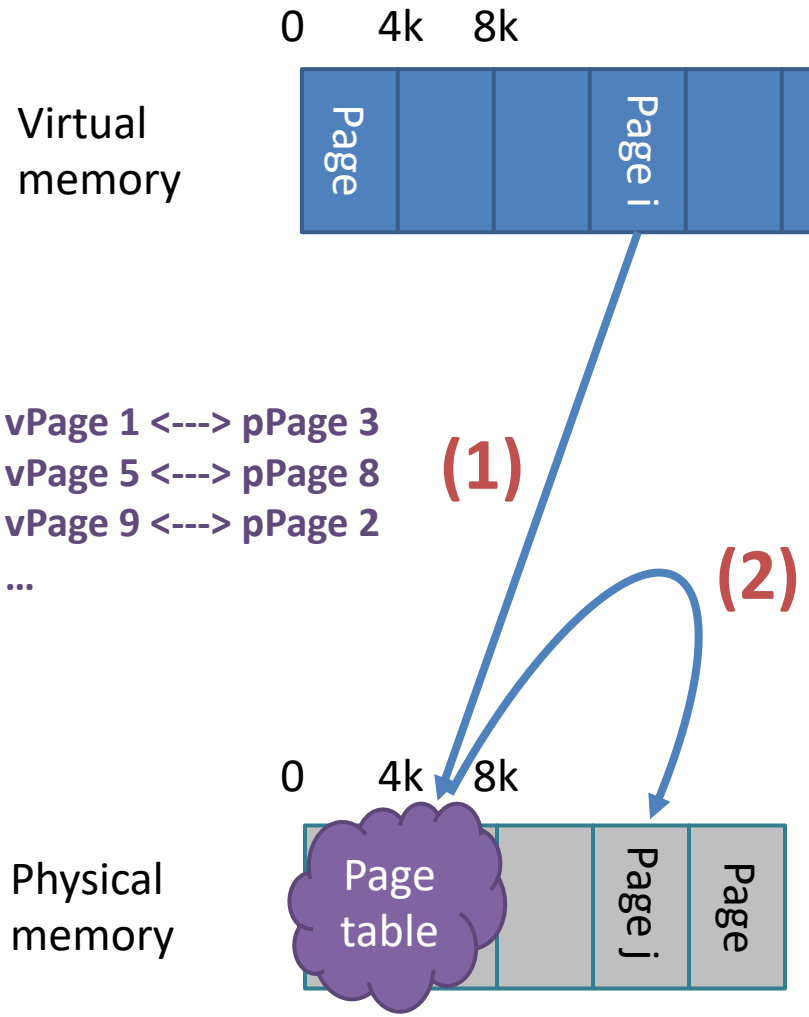
Size of page table
= 2^{20} * 4Byte = **4MB**

Where does the page table exist?



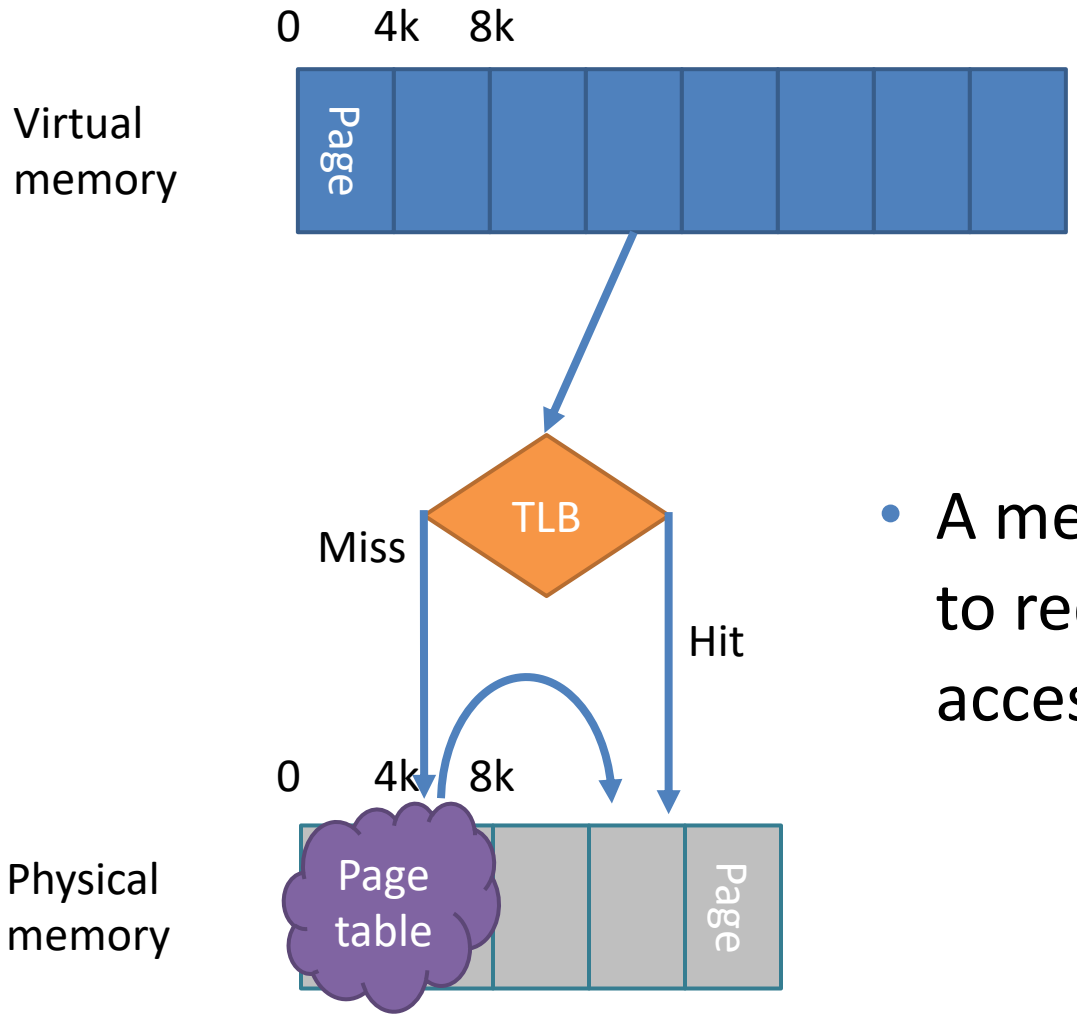
The table is located inside the **physical memory** and maintained by the **OS**

Page table lookup



- Every visit to memory requires two times of physical memory access:
  - 1, access to page table
  - 2, visit the destination address
- Poor Performance

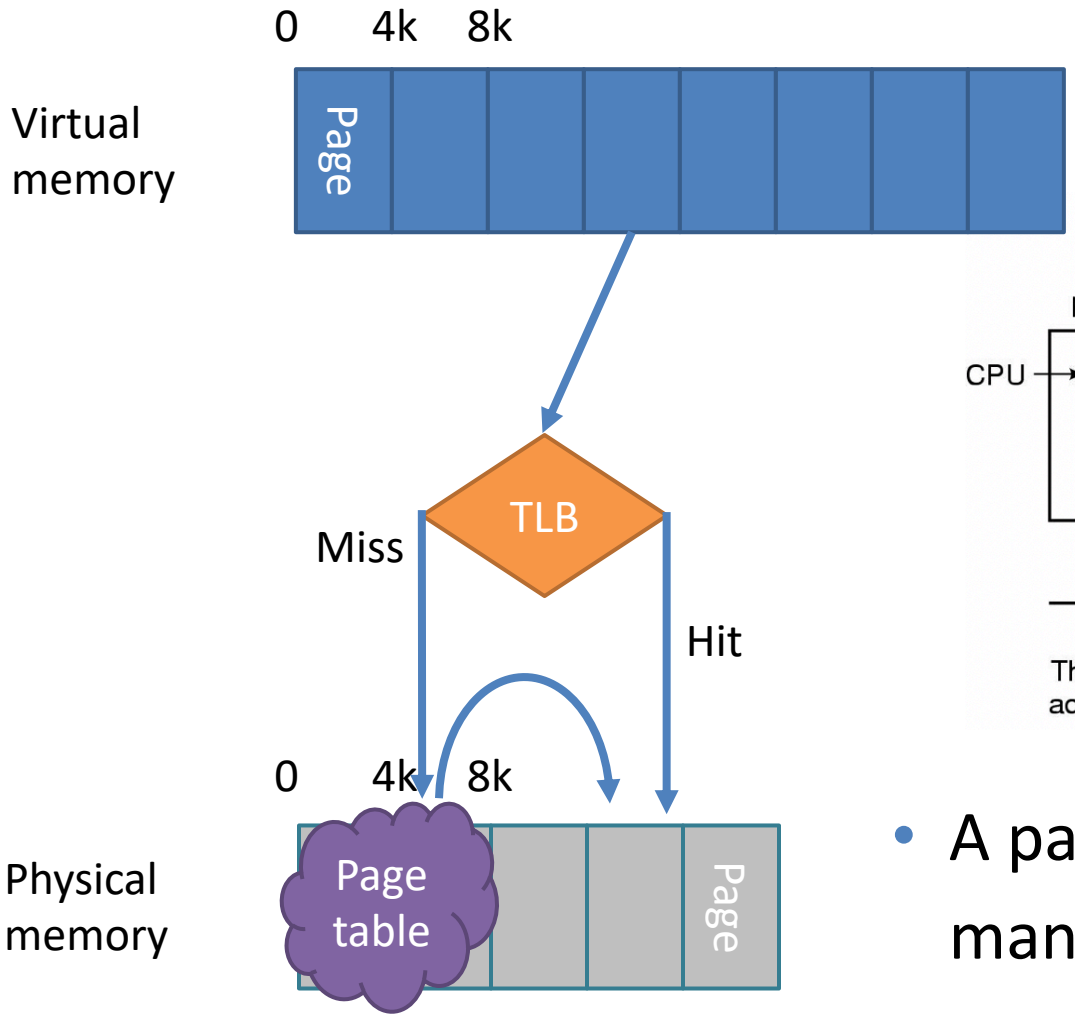
Translation Look-aside Buffers (TLB)

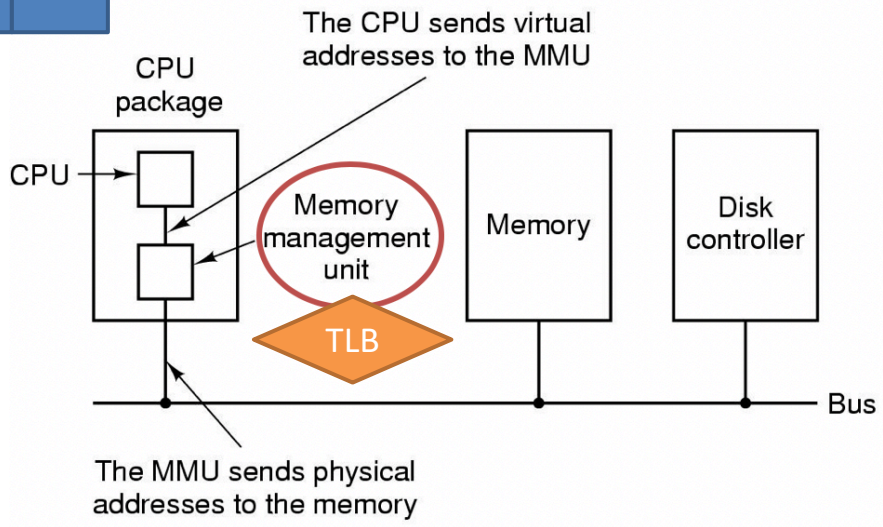


TLB greatly improves the efficiency!

- A memory cache that is used to reduce the time taken to access a memory location

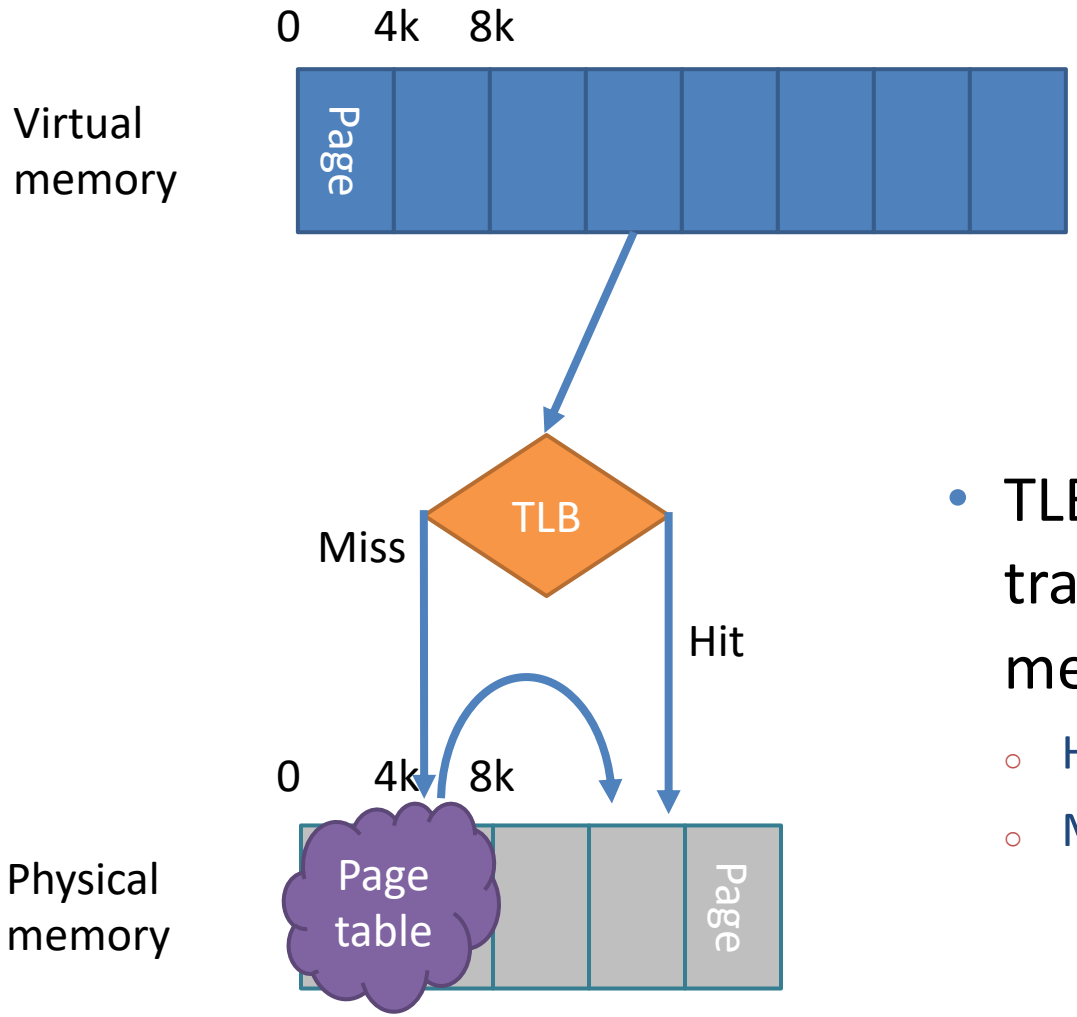
Translation Look-aside Buffers (TLB)





- A part of the chip's memory-management unit (MMU)

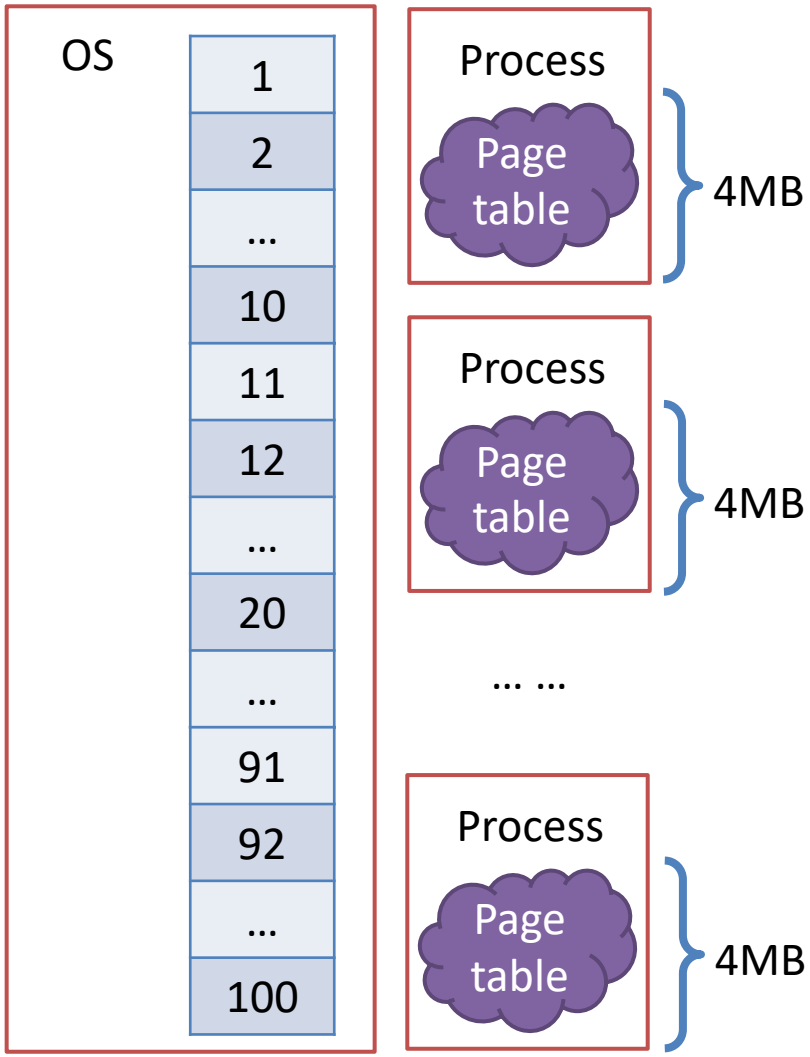
Translation Look-aside Buffers (TLB)



TLB greatly improves the efficiency!

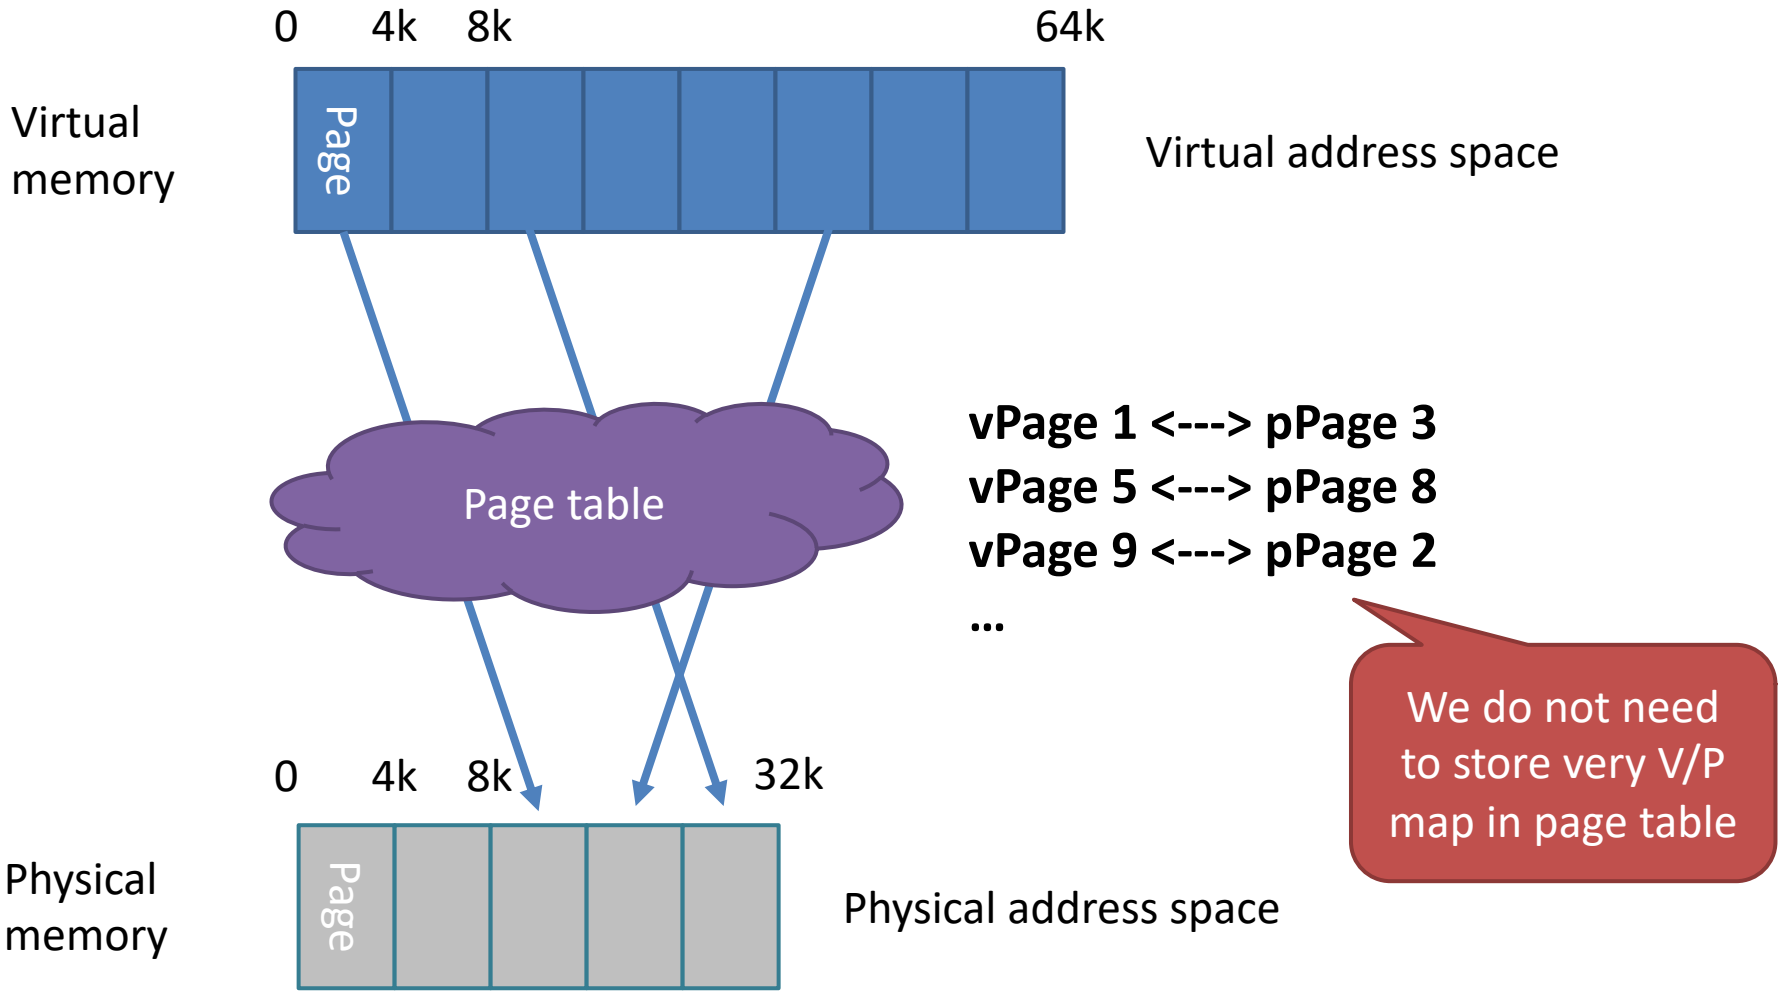
- TLB stores the recent translations of virtual memory to physical memory
  - Hit, access directly
  - Miss, visit the page table

Page table problems



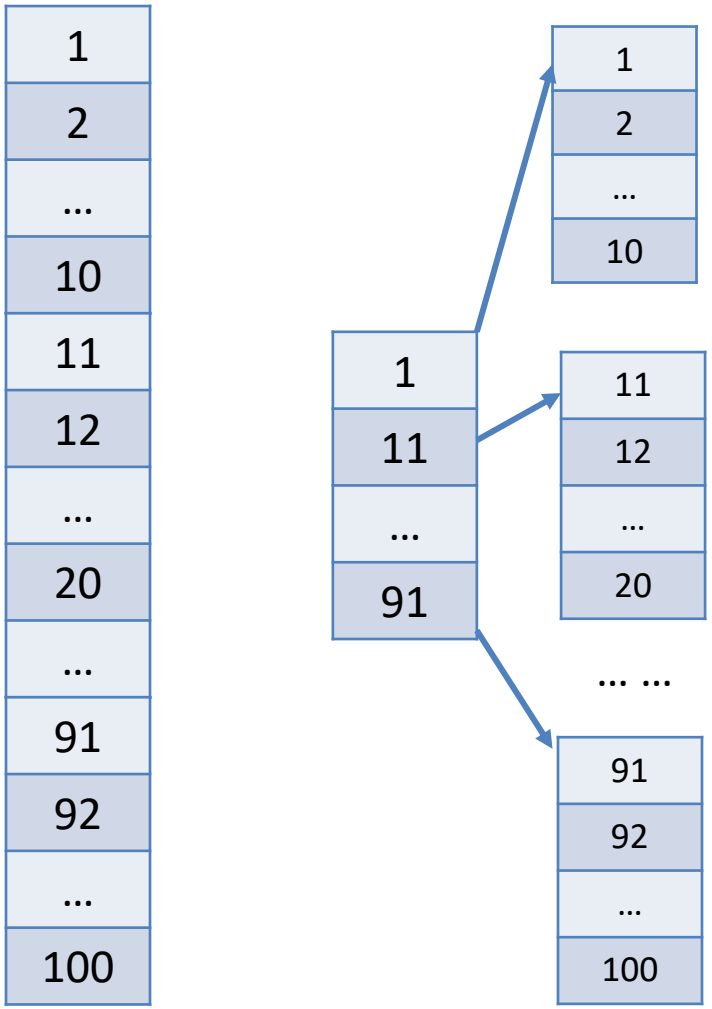
- Page table is a per-process data structure
- Large amount of memory could be used to store page table

Page table size optimization



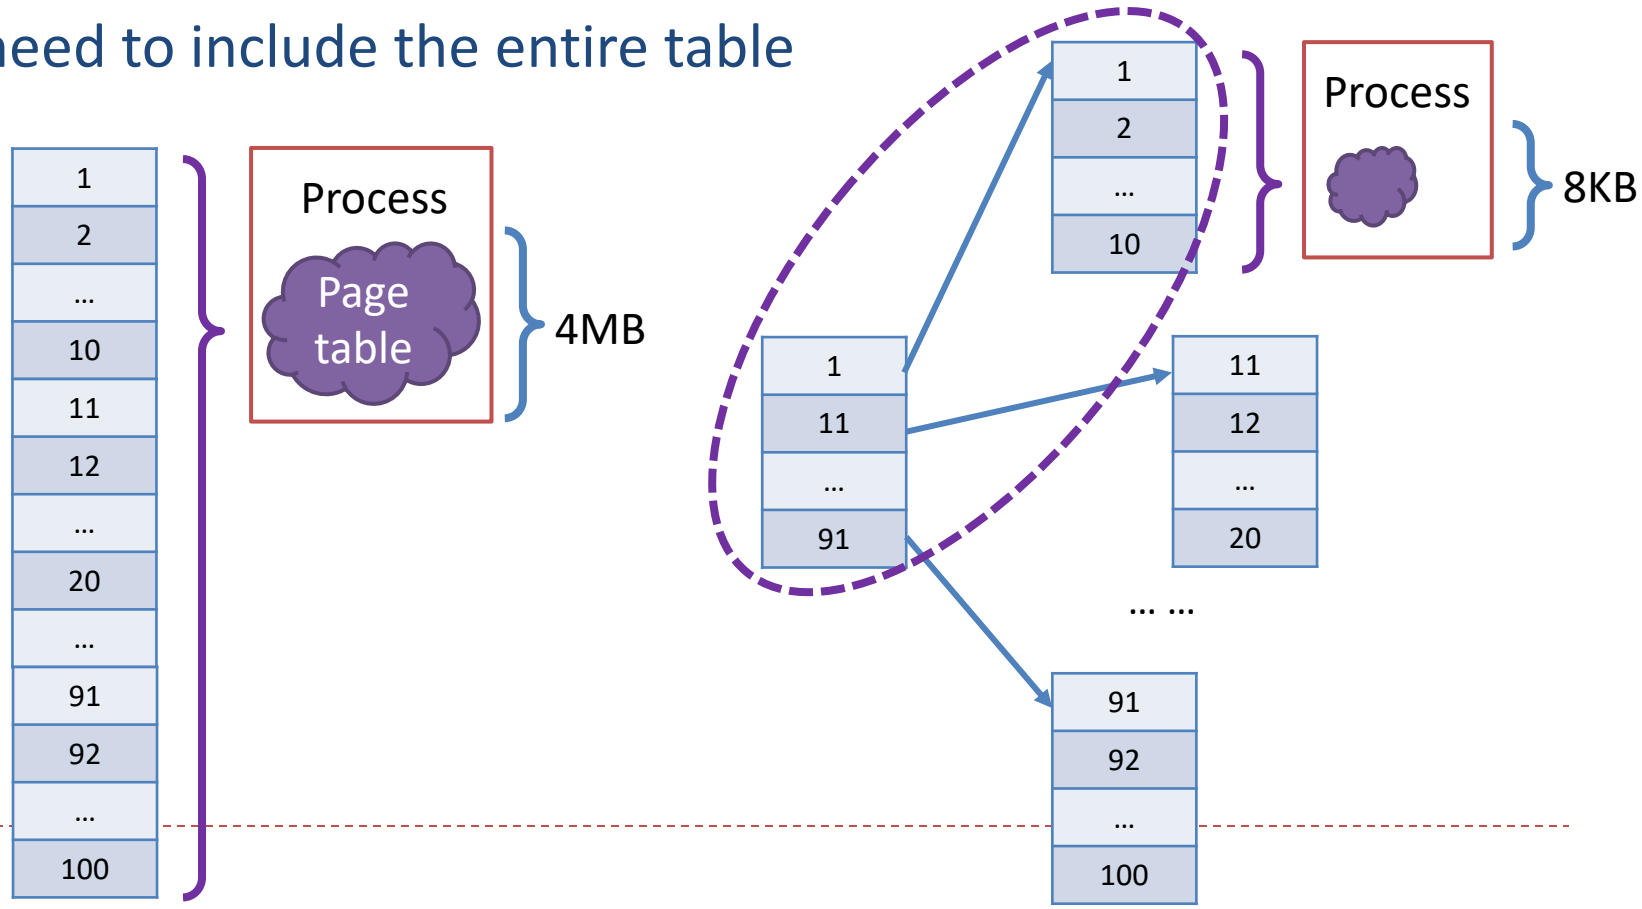
Multi-level Page Tables

- Multi-level page tables can reduce the memory occupied by page tables and improve the memory efficiency



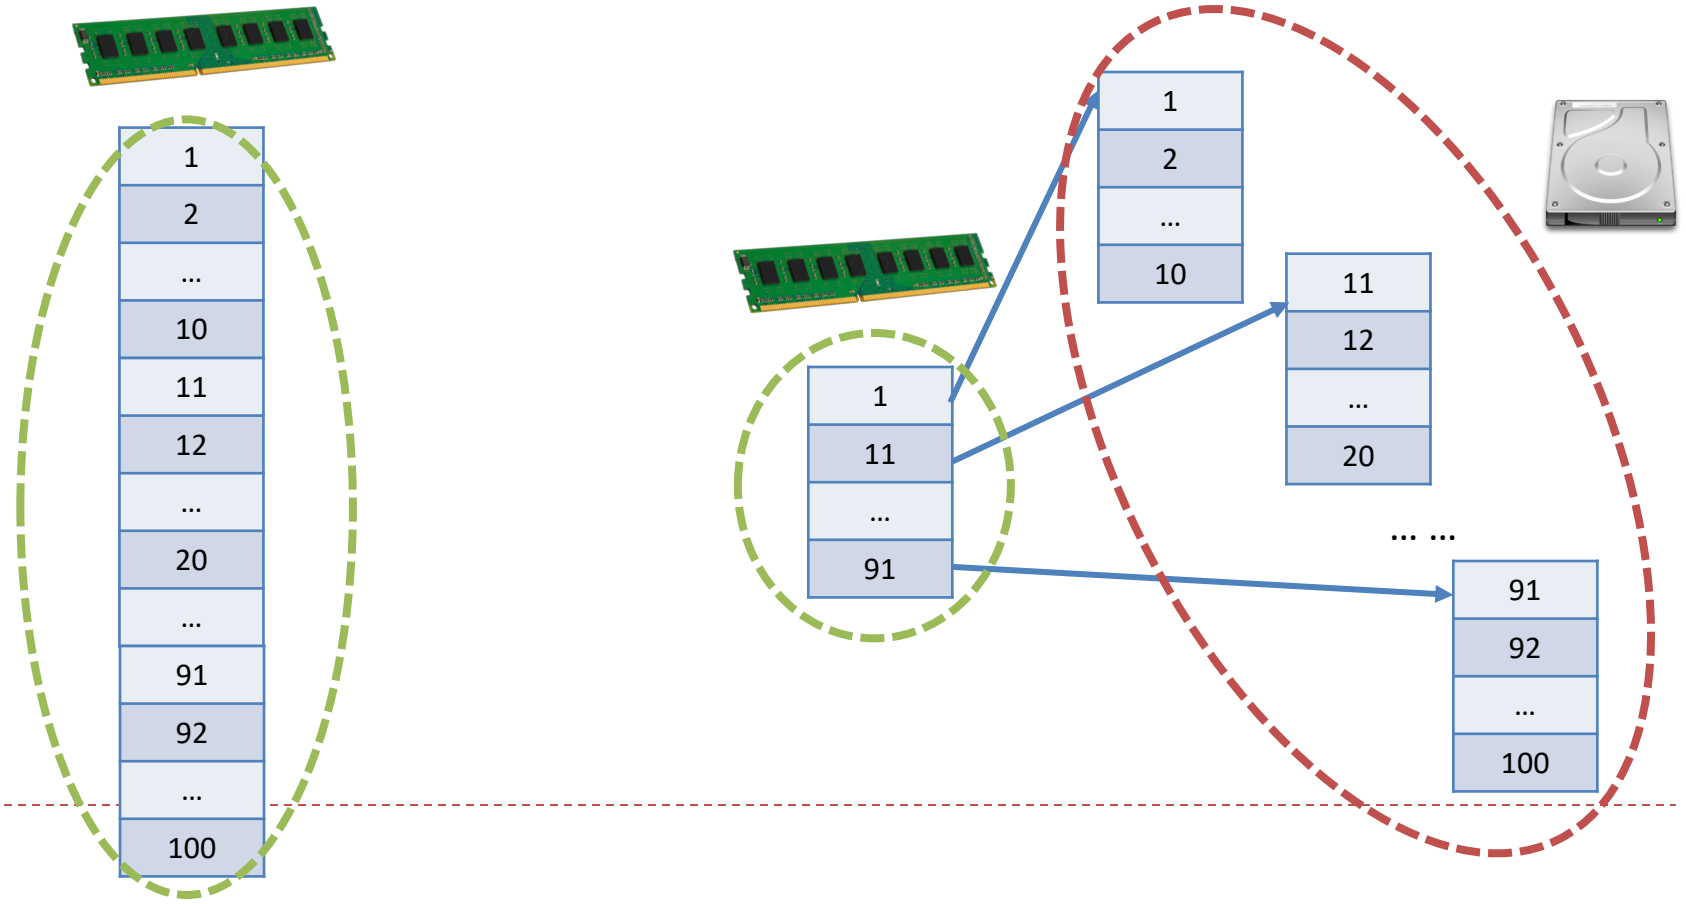
Multi-level Page Tables benefits

- Save memory space
  - 1) Far less page table to individual process (locality), not need to include the entire table



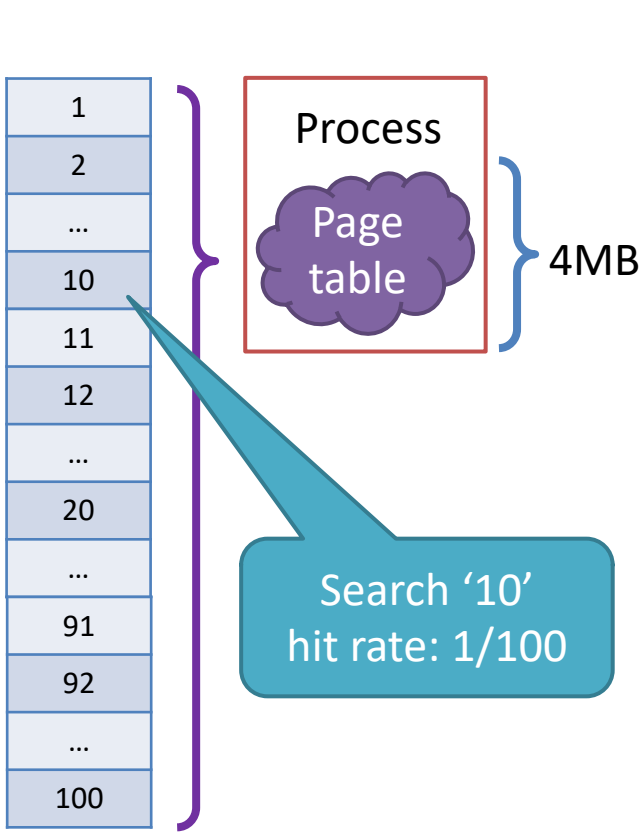
Multi-level Page Tables benefits

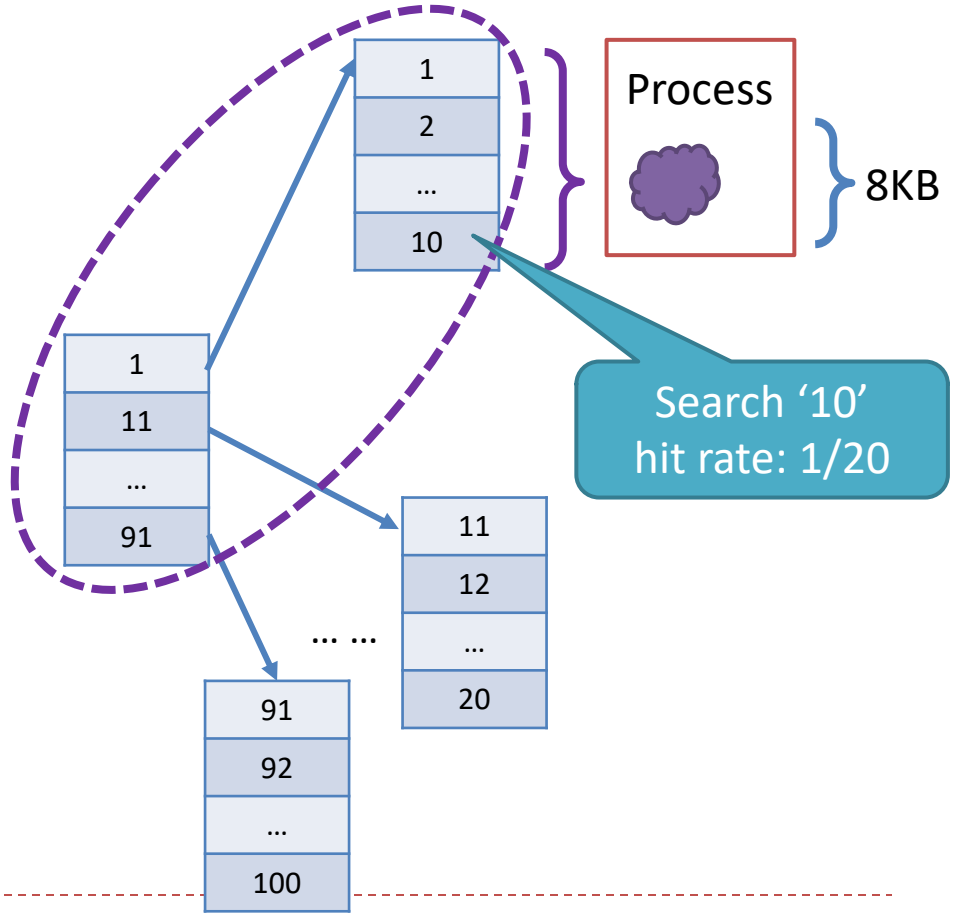
- Save memory space
  - 2) Second level page might not exist in memory, could be on the disk



Multi-level Page Tables benefits

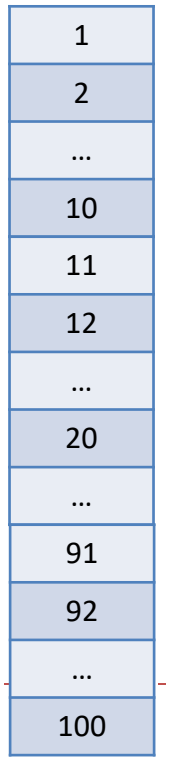
- High access efficiency due to table index



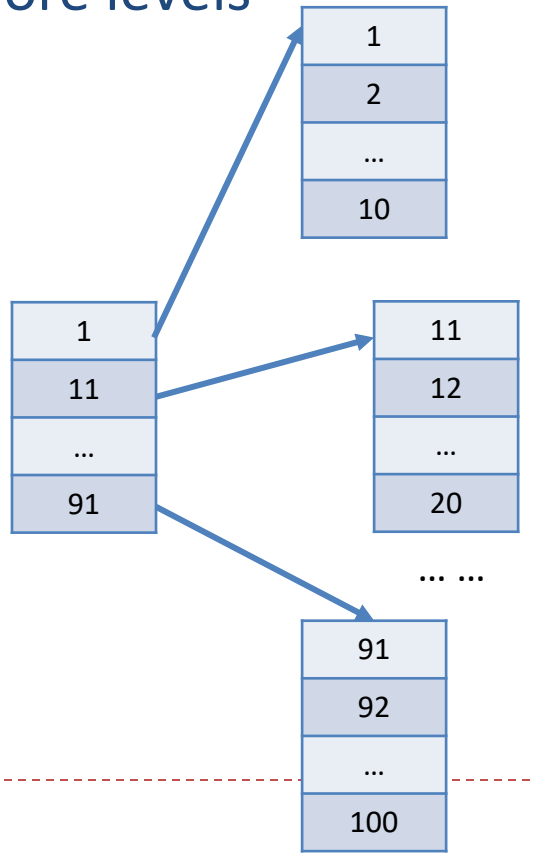


Multi-level Page Tables drawbacks

- Drawbacks
  - Index space
  - Higher complexity with more levels



Total amount space for single level page table is 100



Total amount space for single level page table is 110

Multi-level Page Tables

- Benefits:
  - Save memory space
    - 1) Far less page table to individual process (locality), not need to include the entire table
    - 2) Second level page might not exist in memory, could be on the disk
  - High access efficiency due to table index

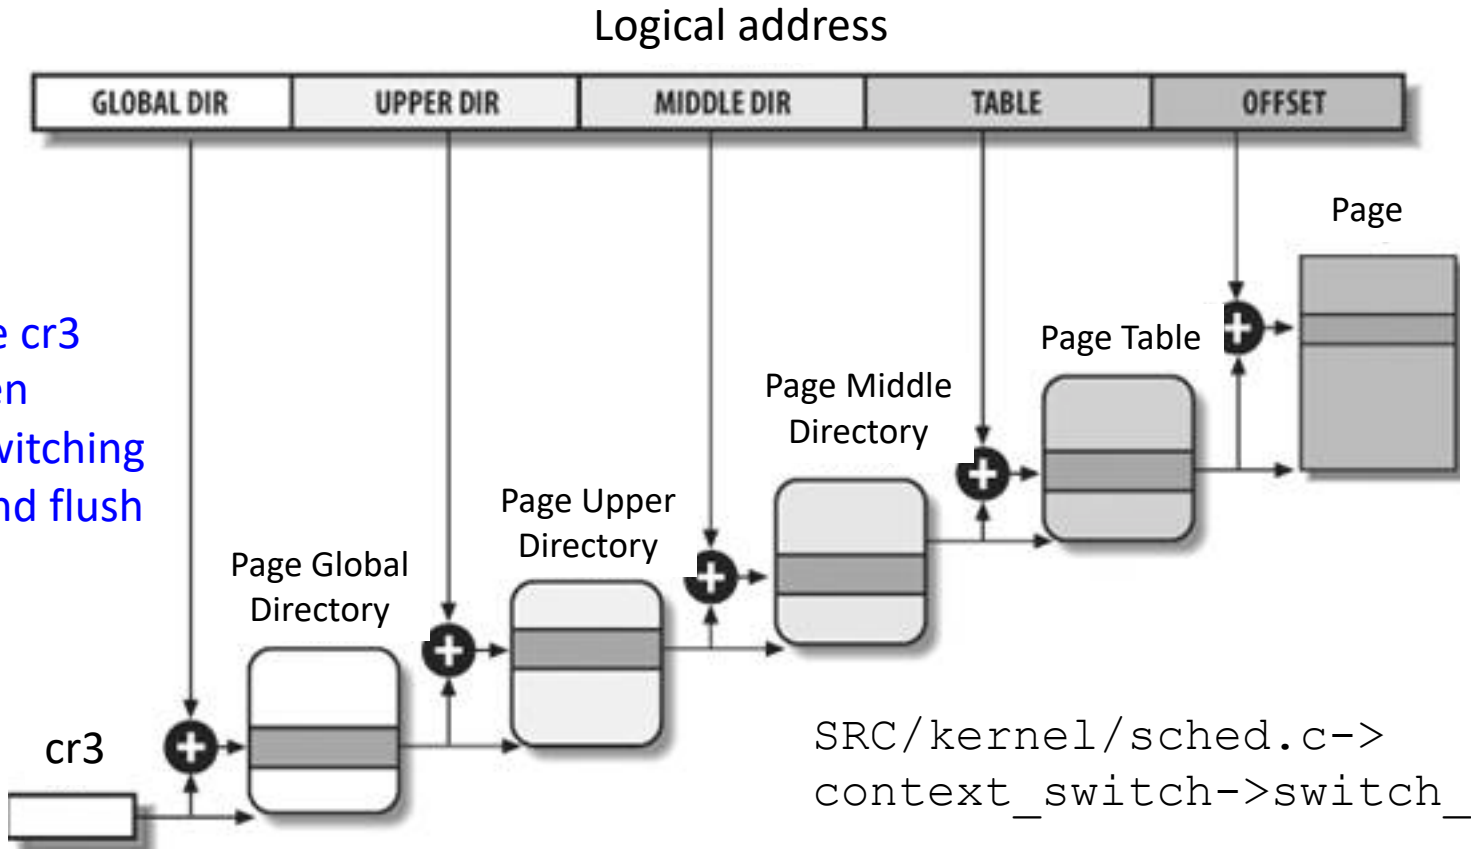
- Drawbacks:
  - Index space
  - Higher complexity with more levels

Multi-level Page Tables in Linux

https://elixir.bootlin.com/linux/latest/ident/pgdval_t

A common model for 32-bit (two-level, 4B pte) and 64-bit (four-level, 8B pte)

`SRC/include/linux/sched.h->task_struct->mm->pgd`

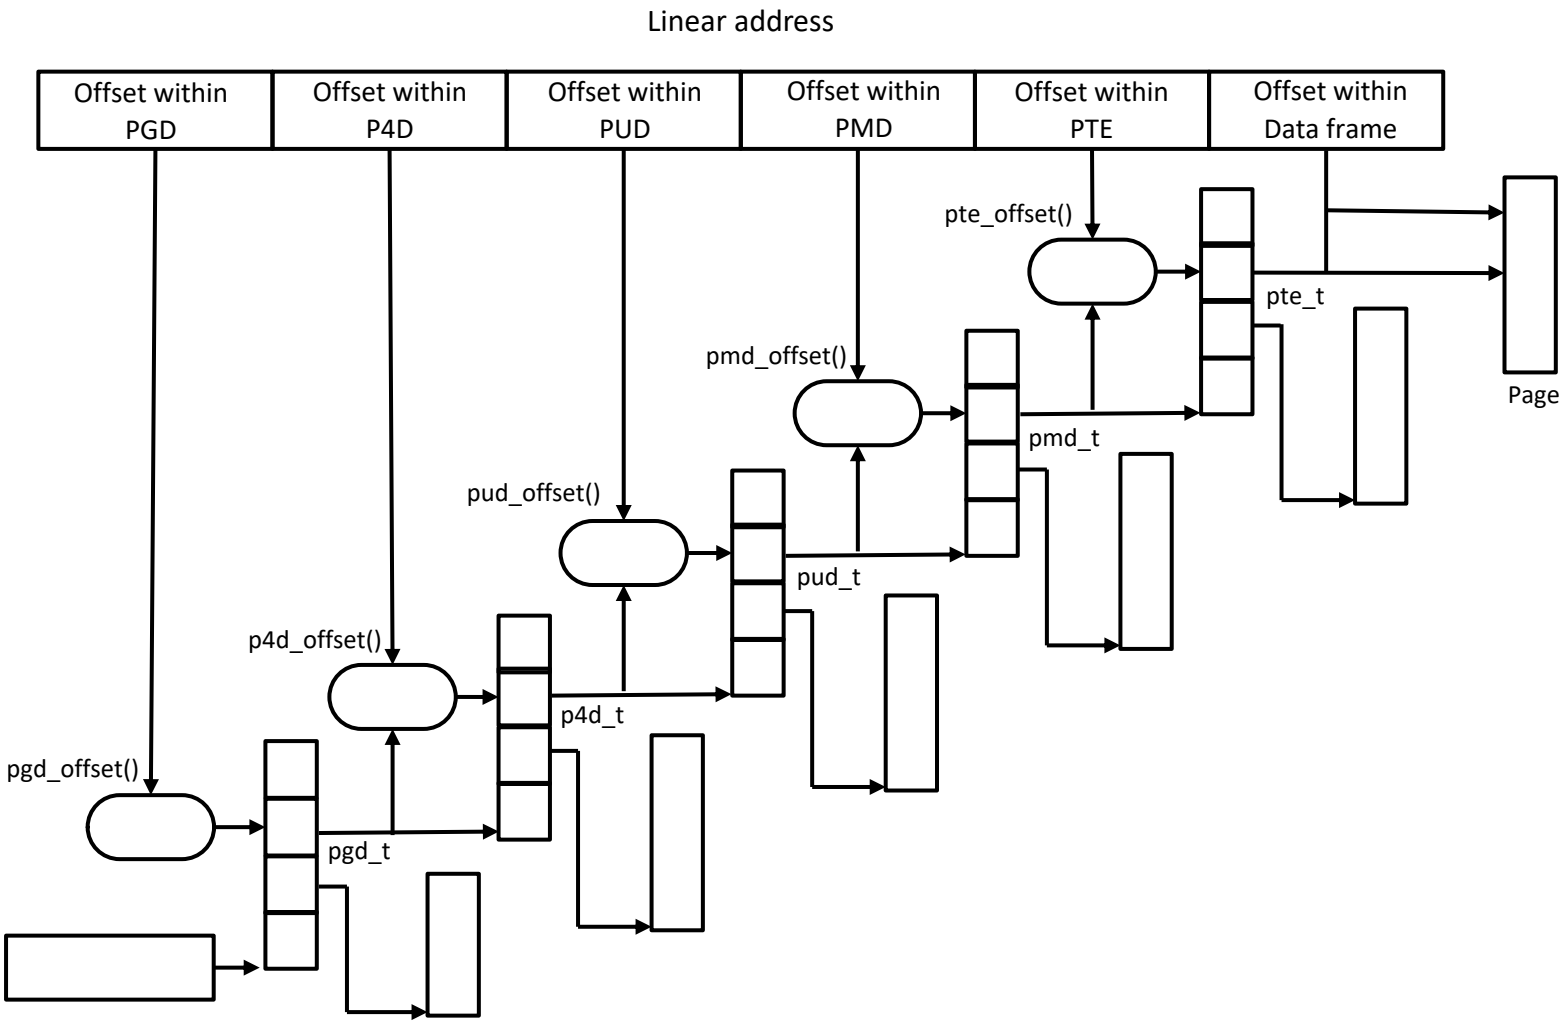


Switch the cr3 value when context switching threads and flush the TLB

`SRC/kernel/sched.c-> context_switch->switch_mm`

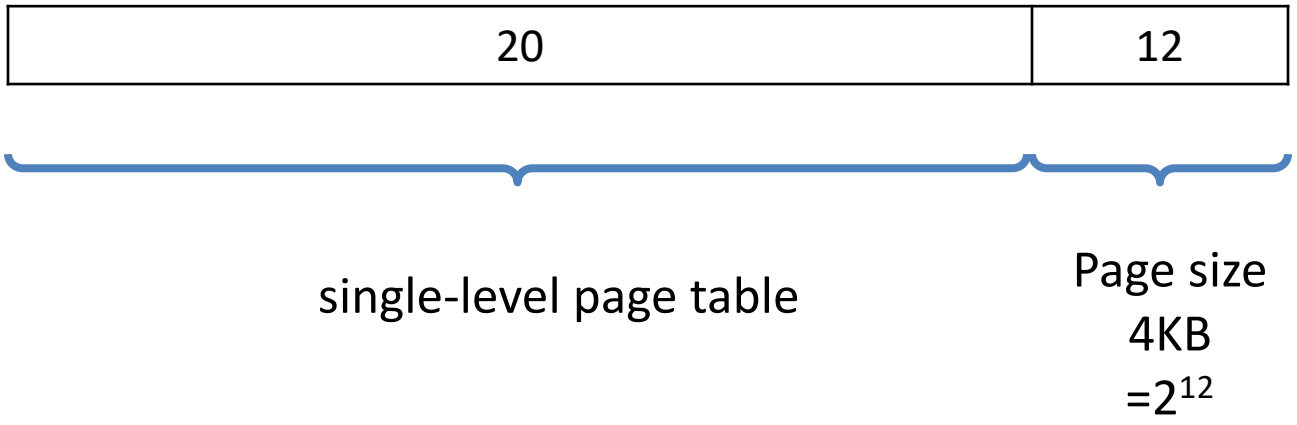
Multi-level Page Tables in Linux

https://elixir.bootlin.com/linux/latest/ident/pgdval_t



Multi-level Page Tables Example

- In a 32-bit system, a single-level page table with 4KB pages.



Multi-level Page Tables Example

- In a 32-bit system, a single-level page table with 4KB pages. Suppose PT1=1, offset=10, what is its virtual address?

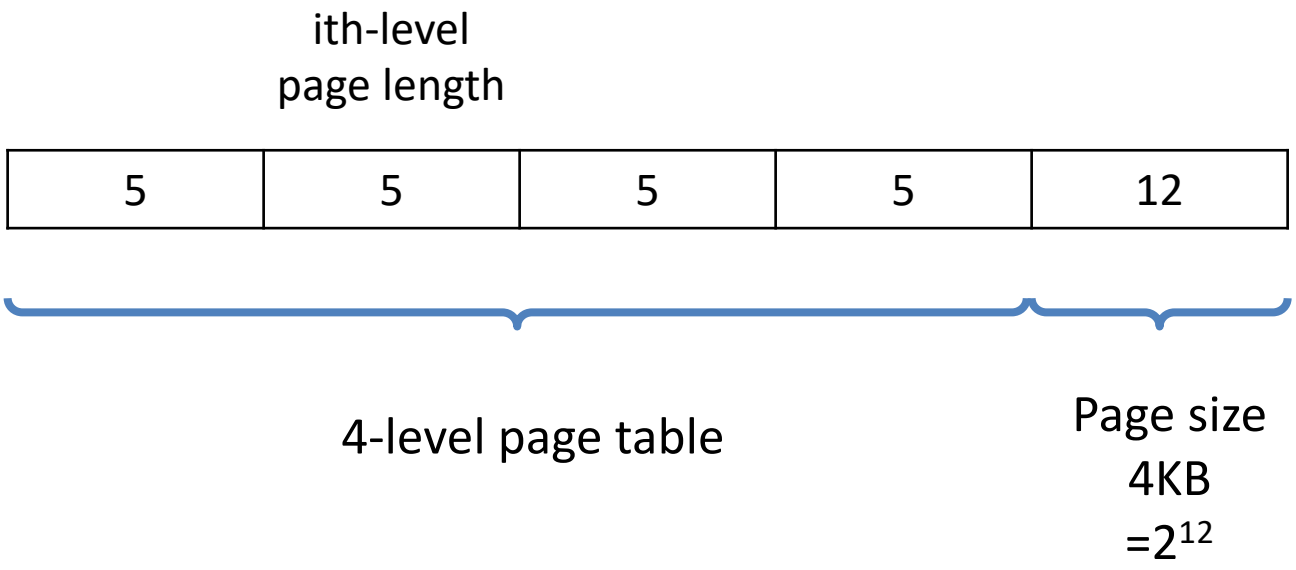
single-level page table

Page size
4KB
$=2^{12}$

The virtual address = $1 * 2^{20} + 10 = 1048586$

Multi-level Page Tables Example

- In a 32-bit system, a four-level page table with 4KB pages. Each level is equal



Multi-level Page Tables Example

- In a 32-bit system, a four-level page table with 4KB pages. Each level is equal. Suppose PT1=1, PT2=2, PT3=3, PT4=4, offset=10, what is the virtual address?

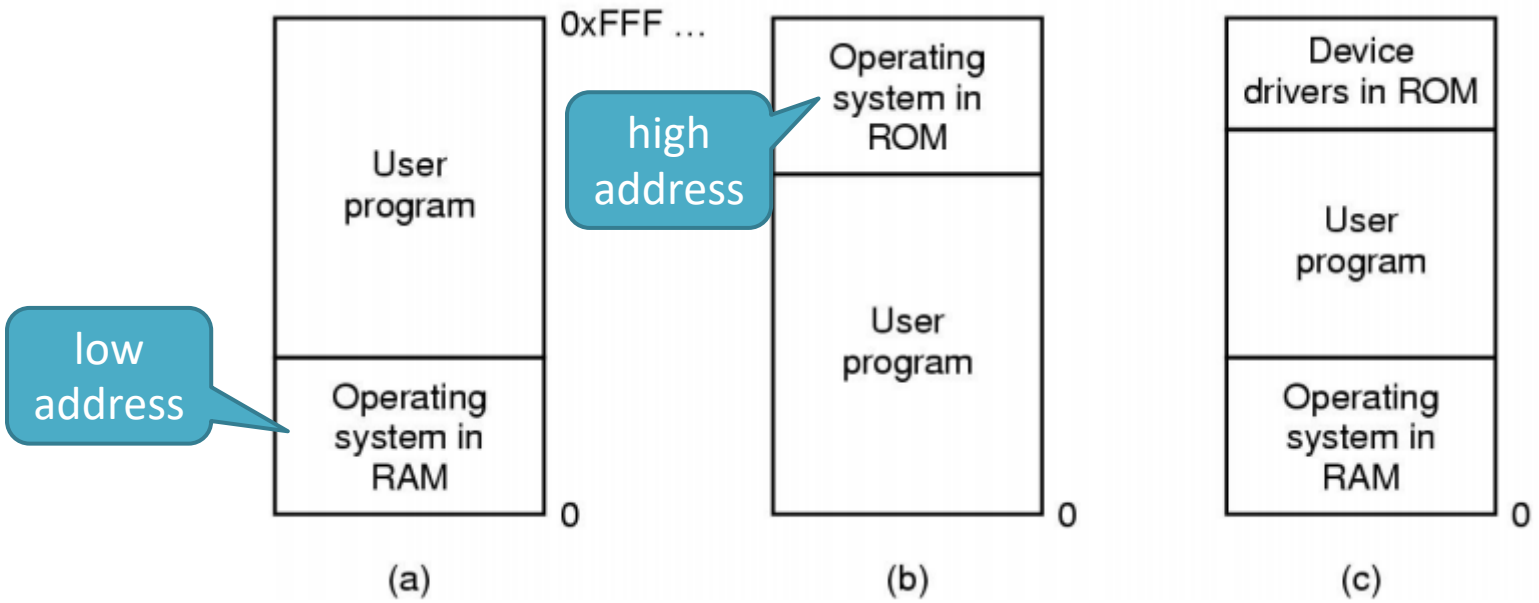
The virtual address = $1 * 2^{27} + 2 * 2^{22} + 3 * 2^{17} + 4 * 2^{12} + 10 = 143015946$

Conclusion

- Memory management overview
  - Memory abstraction and address spaces
  - Physical address and virtual address
  - Physical memory and virtual memory
- Memory management
  - Translation look-aside buffer
  - Page table
  - Multi-level page table

Without memory abstraction (early era)

Memory management is simple. Put small piece for OS, the rest for apps.



Three simple ways of organizing memory:

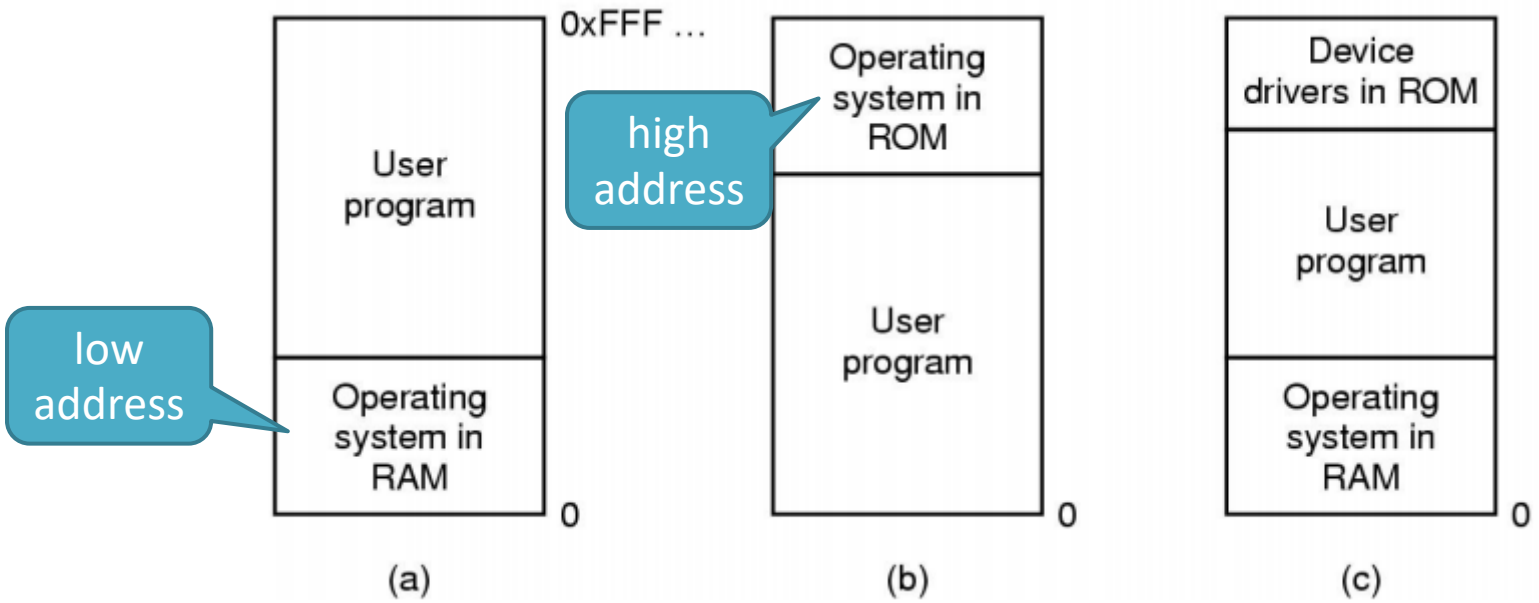
(a) early mainframes.

(b) Handheld and embedded systems.

(c) early PC.

Without memory abstraction (early era)

Memory management is simple. Put small piece for OS, the rest for apps.

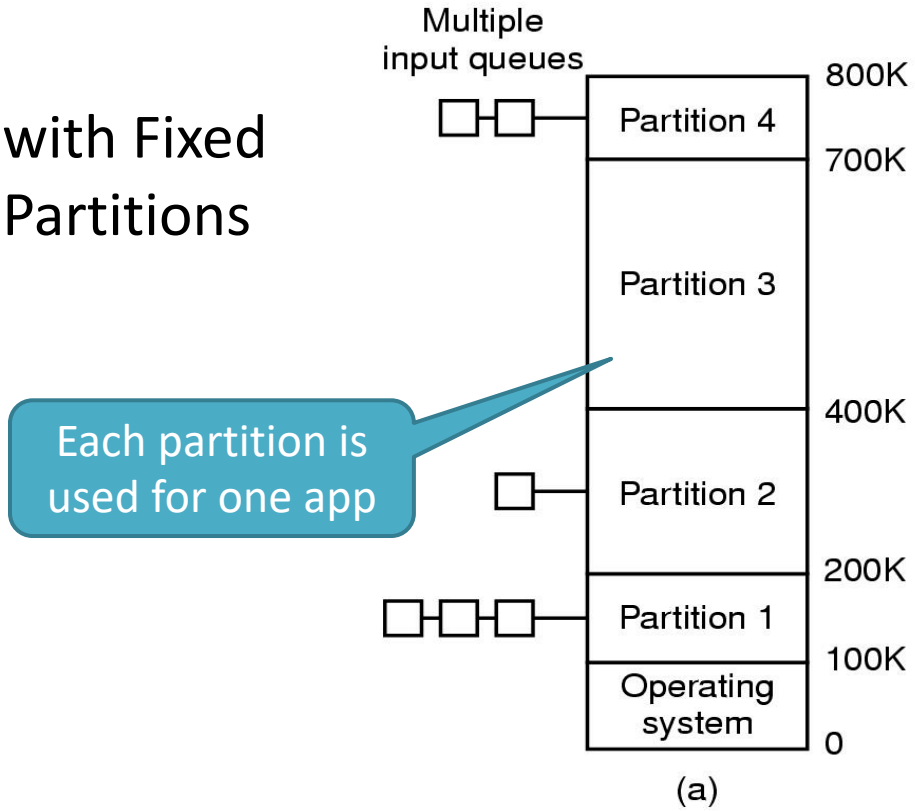


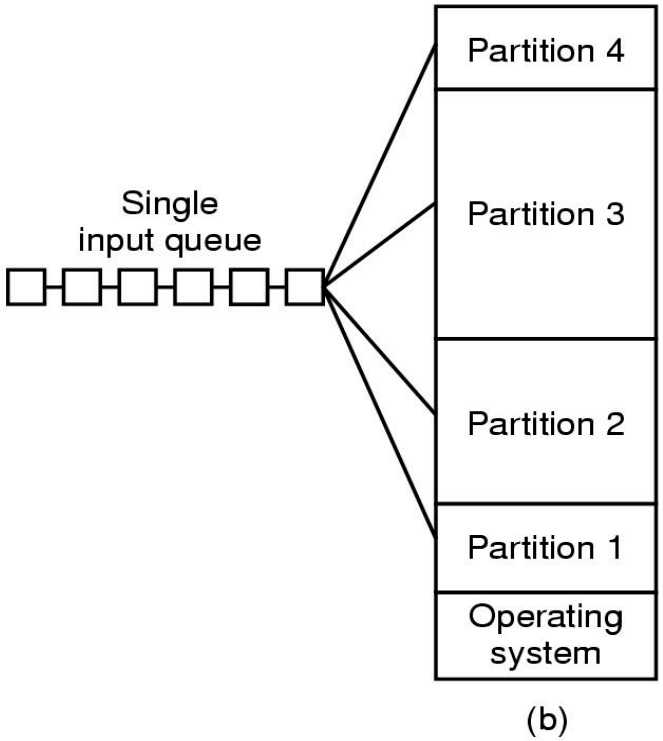
Problems:

Simple memory organization: Cannot support multi-programming and only works for devices, like washing machines, microwaves, etc.

Without memory abstraction (How to support multiprogramming)

with Fixed Partitions



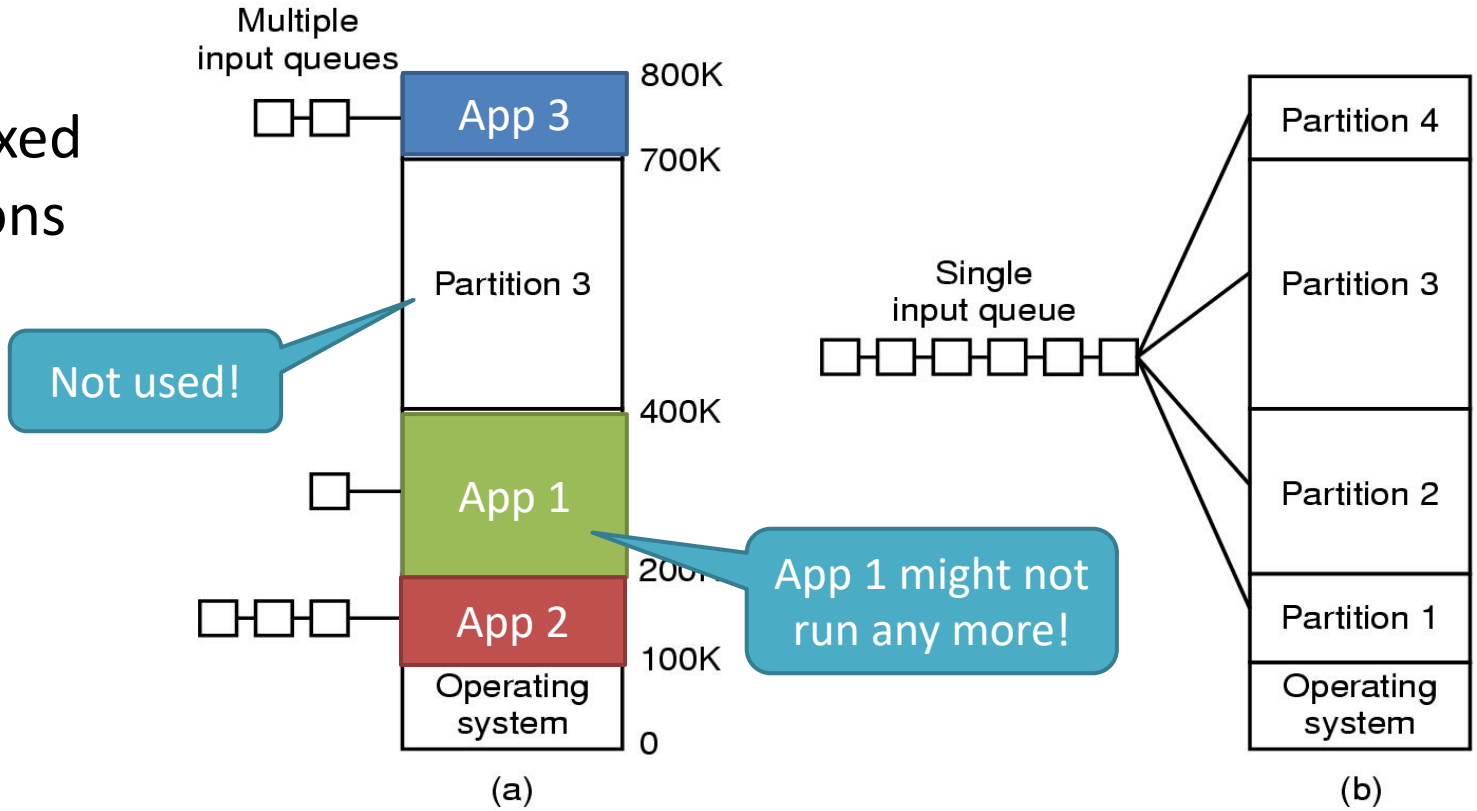


(a) separate input queues of processes for each partition

(b) single input queue

Without memory abstraction (How to support multiprogramming)

with Fixed Partitions

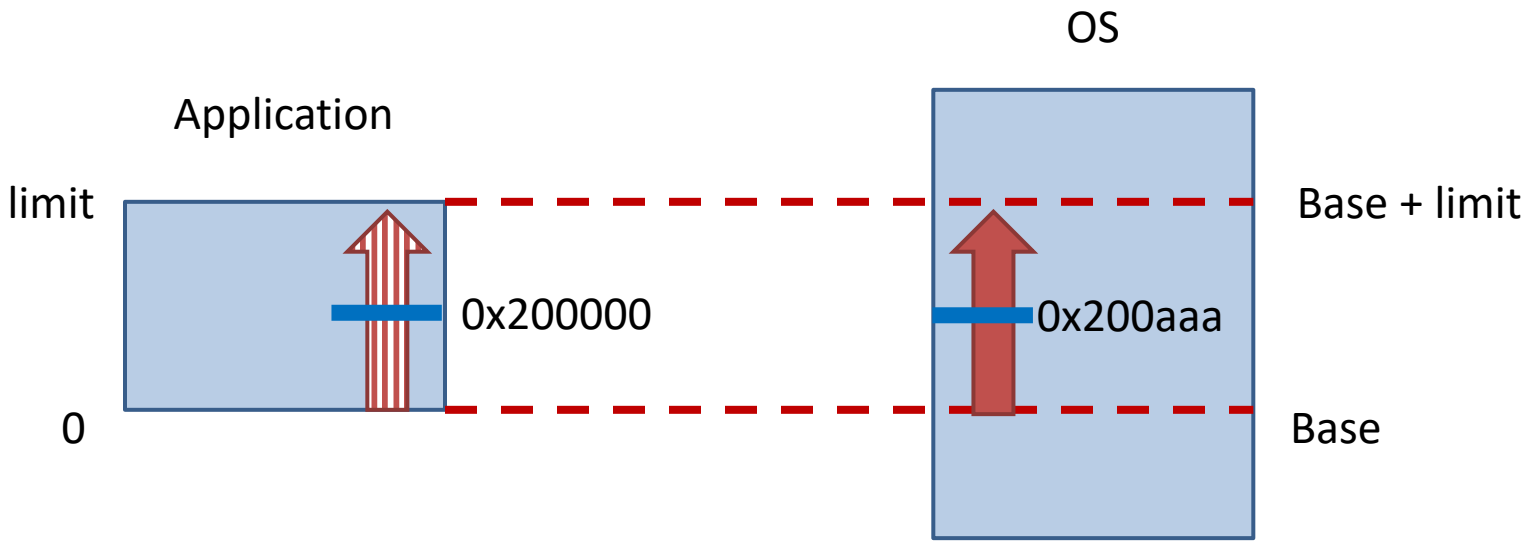


Problems:

(a) fragmentation
(b) low efficiency

Memory Abstraction: Address Spaces

- OS dynamically relocates programs in memory
  - Two hardware registers: base and limit
  - **Base**: start address of a process
  - **Limit**: the upper bound address of a process
  - Hardware adds relocation register (base) to virtual address to get a physical address



Memory Abstraction: Address Spaces
